
#### Abstract

This dissertation is a study of the lives of some of the people enslaved on rural plantations and farmsteads in the northern Shenandoah Valley region of Virginia. Scholars did not widely acknowledge the presence of slavery in the Valley before the 1990s, and this is the first work to provide an in-depth view of the lives of enslaved Shenandoahans before 1860. Specifically, this project answers two questions: what was life like for enslaved people in the Shenandoah Valley, and how did they shape the region's political economies. Data for this project comes from archaeological excavations at the main enslaved quartering site at Belle Grove Plantation and $19^{\text {th }}$-century written sources from Frederick and Shenandoah Counties, Virginia, and Jefferson County, West Virginia. Using these sources, this dissertation assesses 1) the impact grain agriculture had on enslaved people and the economic impact of enslaved farmers, 2) the food rations issued to enslaved Shenandoahans and the ways they grew, gathered, raised, and hunted at night and on Sundays to ensure their families had enough to eat, 3) how restrictions on enslaved people's consumption practices limited their ability to travel to, and buy goods from, cities, towns, and country stores, 4) the ways enslaved people used imported tea and tablewares and locally-made utilitarian ceramics to make lives for themselves, and the larger economic implications of these actions, and 5) the struggles between enslaved Shenandoahans and their enslavers that took place through local landscapes. In addition to its contribution to Shenandoah Valley history, this dissertation proposes new ways of theorizing archaeological research on enslaved life that draws heavily from assemblage thinking and Black studies, focusing on ontological politics through which how enslavers defined enslaved people as a different type of human than themselves and enslaved people redefined their humanities on their own terms.

# ASSEMBLING ENSLAVED LIVES: <br> LABOR, CONSUMPTION, AND LANDSCAPES IN THE NORTHERN SHENANDOAH VALLEY

## Acknowledgments

This project did not take a village to come to fruition. It took something closer to a city. Dozens of people at multiple institutions helped along the way, and I owe everyone an immense debt of gratitude. First, I would like to thank my committee. Theresa Singleton, who served as my advisor, has been a constant source of support during my time at Syracuse. She gave me space to play with new methodologies and theories while ensuring that my work was grounded and coherent. Often, it was Guido Pezzarossi who introduced me to these new theories and methods, and his input has heavily shaped how I approached the dissertation. Shannon Novak helped round out my education in the new materialism and did her best to keep me focused on embodiment. Doug Armstrong helped me get the project started and provided much-needed support over the past few years. Finally, I want to thank Matt Reeves for stepping in at the last second to serve as the external committee member, and for hiring me to work at Montpelier in 2011. That job got me out of CRM and made me realize for the first time that I wanted to get a PhD and do academic research. I want to thank my cohort (Tony Chamoun, Terese Gannon, Ipshita Ghosh, LuAnn Jamieson, and Ajaya Mali) and the other graduate students at Syracuse (especially Oluseyi Abgelusi, Mafe Fernanda Boza Cuadros, Mel Darroch, Rachel Deal, Steven Harris, Morgan Ireland, Maria Smith, Dana Olesch, Giulia Perucchio, Sarah Platt, Sean Reid, Mariel Rivera, Nimisha Thakur, and Alanna Warner-Smith) for their friendship and for always being there to lend a helping hand. Finally I want to thank JoAnn Rhodes and Jackie Wells for all their invaluable help over the past few years.

I could not have done this research without the constant support of staff members and volunteers at Belle Grove Plantation. Belle Grove provided housing while I was in the field, grants to fund much of the fieldwork, and a steady stream of volunteers to help wash artifacts. I
especially want to thank Kirsten Laise for her friendship, for doing whatever she could to support this research, for choosing to prioritize research on the lives of people enslaved at the plantation, and for her encouragement over the past seven years. I would also like to thank John Adamson, the Black studies group, Denis Campbell, Rich Coyle, Mike Kehoe, Mark Ludlow, Robin Lyttle, Shannon Moeck, Kelynn Powell, Nick Powers, Kyle Rothmich, Wayne Sulfridge, and Robin Young for their support and friendship.

Fieldwork at Quarter Site B lasted five years, and the laboratory work is still ongoing. $A$ lot of people helped with this work, and I deeply appreciate all of you. First and foremost, I would like to thank Erica Moses for her invaluable work serving as the assistant director for the excavations, her GIS wizardry, and her all-around technical expertise. Every good map or photo in this dissertation was done by her. Numerous volunteers helped out during the first two field seasons, including D.J. Berry, Meredith Bissett, Donna Greer, Mark Greer, Christine Heacock, Madison Henley, Hannah James, and Scott Parker-Oliver. Sarah Corkett and Kelynn Powell served as interns for the 2016 and 2017 field seasons (respectively). In 2018 and 2019 Belle Grove hosted field schools from Hood College. I would like to thank Dave Hixson and Jenny Ross for organizing and helping to run the field school. I would also like to thank the participants of the 2018 (Jessica Burnette, Mary Hallaren, Michael Dobsha Nathan Purser, Marisa Reel) and 2019 (Thomas McMichael, Ryan Smith, and Zachary Snider) field schools, and the volunteers who helped during the 2018-2019 field seasons (Anna Garzelloni, Ashley Jenkins, Paul Johnson, Kelynn Powell, Michaela Roderick, Kevin Stansfield, Katie Toomey). Kate Bajorek, Caroline Oxley, Laura Paisley, and Linda Seminario served as interns for the 2018 and 2019 field seasons, and Kate Bajorek served as crew chief for the 2019 season. The 2018 metal detector survey was led by Mark Ludlow and was conducted by Mark, Randy Evans, Lisa Evans, Karin Johnson,

Paul Kadel, Mike Kehoe, Marcus Lemasters, George Semple, and Linda Zuckerman. Mike Kehoe conducted additional metal detecting in 2018 and 2019.

On the lab side, Brett Atwood and Kate Bajorek helped catalog artifacts, and I would like to thank all the student volunteers who washed artifacts. Additionally, Kate Bajorek analyzed eggshells from the site, Scott Oliver-Parker analyzed faunal remains, and Linda Seminario analyzed ethnobotanical specimens. I could not have pulled off the chapter on hunger without their help, and I have learned so much from them over the past few years. John Adamson, Lindsay Bloch, Rick Kriebel, and Nick Powers provided samples for the neutron activation analysis. I owe an immense debt of gratitude to Pate Brooks and the University of Virginia's Chemistry Department for giving me the space and equipment to conduct the Fourier-transform infrared spectroscopy analysis. I could not have done that part of my research without their generous help. I did the archival research at Shenandoah County Library's Truban Archives and Handley Regional Library’s Steward Bell, Jr. Archives. I want to thank Becky Ebert, Zack Hottle, and the archive volunteers at Handley for their assistance and recommendations.

Funding for this research has come from multiple sources. Kristen Laise secured grants from the National Trust for Historic Preservation, the Wilkins Family Trust, and Crescent City Charities. Additional funding came from Syracuse University's Maxwell School and Sigma Xi. Along the way, equipment was generously supplied by the Montpelier Archaeology Department (courtesy of Matt Reeves) and Syracuse University (courtesy of Doug Armstrong and Guido Pezzarossi). My studies at Syracuse have been funded by teaching assistantships through the Anthropology Department, an external fellowship with Syracuse's Department of African American Studies, a pre-doctoral internship at the University of Missouri Research Reactor
(MURR), and a pre-doctoral fellowship at the University of Virginia's Carter G. Woodson Institute for African-American and African Studies.

In 2019-2020 I was a pre-doctoral intern at MURR. This opportunity allowed me to do the neutron activation analysis presented in this dissertation, taught me the basics of archaeological science, and afforded me time to delve into the Black studies literature. I want to especially thank Brandi MacDonald for offering me the internship, for her mentorship over the past three years, and for graciously going back and checking (and often having to redo) my statistical analysis and interpretations. I also want to thank Jeff Ferguson, Mike Glascock, and April Oga for explaining how neutron activation works, how to prepare my samples, and how to use Gauss. Additionally, I want to thank Jacques Burlot, Whitney Goodwin, Alexa Kuo, Marc Marino, and Virginie Renson for their friendship and the valuable insights they gave me into archaeological science.

In 2020-2022 I was a pre-doctoral fellow at the University of Virginia's Carter G. Woodson Institute for African-American and African Studies. I wrote and edited most of this dissertation during my time at the Woodson, and if was not for this incredible opportunity I do not know how long it would have taken me to finish writing. I learned so much from everyone and I cannot express how grateful I am to have had the opportunity to workshop my dissertation chapters on hunger and brick chimneys. The insights of the other fellows (especially Ashley Ngozi Agbadoga), Professors Deborah McDowell and Robert Vinson, and my guest interlocuters (Alexander Weheliye and Matthew Johnson) not only improved these chapters but gave me the intellectual sustenance I needed to write the dissertation and the extra boost of energy I needed to get across the finish line. While at the Woodson, I was also able to spend time with the University of Virginia's Anthropology Department. I am grateful to Adria LaViolette for
mentoring me over the past two years, and to the graduate students for inviting me to their weekly happy hours. I am especially grateful to Daniel Chen, Grace East, Richard Handler, and the other members of the Transforming Anthropology Workshop. I would not have sat down and read as much of Sylvia Wynter's work without this workshop and doing so fundamentally transformed how I approach Black studies and the theoretical frameworks I used in this dissertation.

I want to thank my parents, Mark and Donna Greer, for their help and support, whether it be emotional support, helping dig STPs, or letting me store water-screen samples under their deck. I am also grateful to my siblings Alex, Kathleen, and especially Andrew who helped process some of the aforementioned water-screen samples and transcribed newspaper articles for me. In my immediate household, I want to thank Charlie and Calypso for grounding me over the last three years. But most importantly, I want to thank Erica Moses for her love and support. You are the best and I could not have done this without you.

Finally, not everyone who began this journey with me is here today. It has been a rough two years, and I am devastated that Kent Long, Betty Weber, and Lauren Weber are not here to celebrate with me. Additionally, the Belle Grove community has been devastated by the passing of John Adamson, a longtime volunteer, docent, and board member. John was also a friend and a constant source of encouragement. He eagerly read everything I wrote and incorporated it into his tours, going so far as to have discussions of panopticons with visitors. I would like to think that John would have enjoyed reading the dissertation, and I dedicate it to him.

## Introduction: Studying Slavery in the Black Lives Matter Era

"Slavery did not matter in the Shenandoah Valley. Slavery did not matter in the Shenandoah Valley. Slavery did not matter in the Shenandoah Valley." For decades, scholars and fourth-grade history students alike have repeated variations of this statement. The steady, multigenerational rhythm of this chant profoundly shaped the Shenandoah Valley scholars wrote about. Since slavery did not matter, slavery was not discussed in any detail. Since slavery did not matter, enslaved Shenandoahans could not have mattered. And so, Valley history became the history of white Shenandoahans. Yet, slavery mattered profoundly in the Valley from the 1730s to the 1860 s. Enslaved people were not just left out of these histories. Early historians, often the (grand)sons of enslavers, fabricated arguments about why slavery did not exist in the region, and later historians took these stories to be fact instead of reassessing them. These whitewashed narratives went unchallenged until the 1990s when a few historians started acknowledging that $18^{\text {th }}$ and $19^{\text {th }}$-century documents unequivocally demonstrate that slavery did matter in the Valley. This has not stopped the public from chanting "slavery did not matter in the Shenandoah Valley." But it has led some scholars to stop.

These interventions, however, only address half the problem. The institution of slavery is now seen as mattering, but enslaved Shenandoahans are only discussed as cogs in the region's political economies, not as people who lived through slavery and whose choices shaped the world around them. If enslaved lives are to matter in Valley histories, we must study enslaved people. This is the first goal of Assembling Enslaved Lives and I do this by addressing two interrelated questions: What was life like for some of the women, children, and men enslaved on rural farms and plantations in the northern Shenandoah Valley between 1800 and 1850, and how

Figure 1. Location of Shenandoah Valley. Map by Author.
did they affect the region's political economies? I answer these questions using archaeological data from Quarter Site B at Belle Grove Plantation and written sources from archives in the Valley. These materials shed light on some of the things, practices, and institutions that affected and were affected by enslaved people as they labored, bought and used commodities, and inhabited local landscapes. Rather than present a comprehensive study of enslaved life in the region (Figure 1) - which would be far beyond what one study could hope to accomplish - this dissertation provides a new way of approaching and thinking about enslaved life in the northern Valley by focusing on some of the things that shaped daily life. Specifically, this dissertation
look at seeds, plows, and scythes used in grain agriculture, food given to and produced by enslaved people, restrictions on enslaved people's movement through the Valley to buy and sell commodities, ceramics enslaved people bought and used, and plantation landscape at Belle Grove Plantation.

I do not use the term political economies to signal a Marxist approach to the archaeology of enslaved life (e.g., Delle 2014; Leone 2010; Orser 1988; B. J. M. Weaver 2018). Rather, I use it to describe the inseparability of economics and the power relations of slavery in the Shenandoah Valley. To theorize these connections, and how the Valley's political economies affected and were affected by enslaved women and men, I turn to assemblage thinking. This school of thought, largely influenced by the work of Giles Deleuze and Felix Guattari (e.g., 1987), attends to the ways people, plants, animals, and things come together into collectives where they mutually shape each other. These collectives are referred to as assemblages. Other theories (e.g., contextual archaeology, critical theory, practice theory) allow us to focus on how enslaved people affected past political economies, or how these structures impacted their lives. But they generally are incapable of addressing both using the same theoretical concepts, nor do they address the active role plants, animals, and things play in these processes. As a result, assemblage thinking provides a more open framework for interpreting connections between enslaved people and local political economies, one that provides a better starting point for looking at how enslaved people affected the Valley's political economies and how these structures simultaneously shaped the lives of enslaved people in the region and the active way non-human plants, animals, and things affected enslaved people and local political economies.

In Assembling Enslaved Lives, I often use the term "things" instead of objects, items, artifacts, or material culture. While this can be seen as nondescript, or even nonacademic, my use
of "things" comes from thing theory (e.g., B. Brown 2001; 2003; Heidegger 1975), which has heavily influenced archaeologists over the past decade (e.g., Govier and Steel 2021; Joyce 2012; Olsen et al. 2012; Van Oyen 2016). Things, as Fernando Domínguez Rubio $(2016,61)$ argues, are "material processes that unfold over time" (also see Hodder 2012, 7-9) This shifts us from approaching objects/artifacts as stable entities that remain the same throughout time to seeing these entities as continually changing. A tea saucer changed as enslaved people used it, acquiring use wear and having the composition of its paste change as residues seeped into it (see Chapter 8). It changed again when it broke (becoming individual sherds instead of a singular saucer) and it continued to change in the ground after enslaved people discarded it, acquiring new marks and different sets of biomolecular signatures through post-depositional processes. Addressing these transformations pushes us to think about the archaeological record in a more dynamic way (Lucas 2012).

While I was conducting this research, the United States was roiled by report after report of police murdering Black women (Sandra Bland, Atatiana Jefferson, Breonna Taylor...), children (Ma'khia Bryant, Jordan Edwards, Tamir Rice...), and men (George Floyd, Eric Garner, Amir Locke...). "Black Lives Matter" has become a rallying cry for protesting "the racial reality that black lives do not matter" in the United States (Makalani 2017, 533), at least not in the same way that white lives are allowed to matter (also see Benjamin 2018a; Towns 2018; Wynter 1994b). Police do not regularly choke the life from white men suspected of selling loose cigarettes or paying for groceries with a counterfeit bill. Politicians and corporations do not conspire to pipe lead-tainted water into white neighborhoods. Rather, whiteness emerges through and profits from these violent impositions (Benjamin 2018b; Puar 2017). It is "Desperately thirsty for black blood" (Morrison 2004, 79) because the toxic ideology of whiteness can only be
maintained by destroying the social, political, and biological lives of those deemed not white (enough). Black studies scholars have long noted that the taste for blood whiteness developed during colonization and racial slavery gave rise to the forms of racial capitalism, settler colonialism, and white nationalism that the Black lives matter movement is fighting today (e.g., McKittrick 2013; Towns 2018; Wynter 1994b).

Just as archaeologies of enslaved life began in the United States in response to, and as a way to advocate for, the Civil Rights and Black Power Movements (e.g., Ascher and Fairbanks 1971; see Ferguson 1992, xxxv-xxxviii), archaeologies of enslaved life after the 2014 killing of Michael Brown can and should continue our disciplinary legacy of working with and for Black social movements. Justin Dunnavant, Ayanna Flewellen, Maria Franklin, Alexandra Jones, Alicia Odewlade, and Tsione Wolde-Michael (Flewellen et al. 2021; Franklin et al. 2020) have pushed archaeologists to develop new praxes for doing archaeology in the times of Black Live Matter. To this, I would add that studying slavery in the Black Lives Matter era compels us to use our research to rethink the lives of enslaved women, children, and men to show 1) that their lives mattered in the past, 2) the discourses enslavers used to make their lives matter less than white lives, and 3) that enslaved people pushed back against these regimes of power in the $19^{\text {th }}$ century, that just as Black women and men challenge white supremacist discourses today. If, as Matthew Johnson (2010, 2, his emphasis) argues, "theory is the order we put facts in" this approach lets us arrange archaeological and historical facts in a way that highlights the lives of enslaved women, children, and men. Pulling together a theoretical framework to do this is the second goal of Assembling Enslaved Lives.

While assemblage thinking provides a theoretical framework for thinking about how Black lives mattered in the past, I turn to critical insights from Black studies to theorize the
active struggle between enslavers and the enslaved over how Black lives mattered within the political economies of slavery. I am not alone in engaging with Black studies. Other archaeologists have done this since the 1990s, predominantly by working with Black feminism (e.g., Battle-Baptiste 2011; Bulger 2015; Franklin 2001; A. Martin 2018; Morris 2017; Sterling 2015; Sesma 2016; Wilkie 2003), although some works have used other strands of Black studies (e.g., Barnes 2021; Dunnavant 2020; 2021; Flewellen 2017; Flewellen et al. 2021; Hu and Quave 2020; Springate 2014; Odewale 2019; Watkins 2020). What I propose in Assembling Enslaved Lives differs from the existing literature in two ways. First, I engage with the counter-humanist school of thought in Black studies, which addresses how definitions of what it means to be, and who counts as, (fully) human are often political and used to advance social inequalities (e.g., Hartman 1997; Z. I. Jackson 2020; T. L. King 2019; Spillers 1987; Weheliye 2014; Wynter 2003). In the context of slavery, enslavers defined themselves as fully human while defining Black women, children, and men as inhabiting a different, and inferior, ontological category of the human that was capable of being enslaved. As a result, enslavers' racist definitions of humanity provided the ontological basis for slavery. Enslaved women and men, however, often rejected these white supremacist discourses, creating their own definitions of humanity that fit their own needs and desires and allowed them to redress (at least some of) the pain and suffering of slavery. We can think of these competing discourses as an ontological "politics of being" waged between enslavers and the enslaved over the definition of humanity (Wynter 2003, 318). For enslavers, these politics were about perpetuating the institution of slavery and the profits they accrued from Black flesh (Benjamin 2018b; Spillers 1987). For enslaved people, these politics were about making lives for themselves within oppressive anti-Black political economies. Put another way, these politics defined what Black life meant and how Black lives
mattered in the Antebellum South. Other archaeologists cite counter-humanist scholars (Arjona 2016; 2017a; Dunnavant 2020; Flewellen 2017; Schwalbe 2020), but they have not taken up their critiques of humanity. Assembling Enslaved Lives is the first study to apply these theories to archaeological research.

The second way my work stands out is by using insights from the new materialism to theorize the materialities that shaped enslaved life, letting me address how things (cornmeal, chickens, ceramics, bricks, etc.) both advanced and impeded the ontological politics waged over the definition of enslaved humanities. The new materialism, which has been one of archaeology's fastest-growing theoretical trends in the past decade (e.g., Hodder 2012; Fowler 2013; Khatchadourian 2016; Olsen 2010; Olsen et al. 2012), focuses on dismantling the artificial dualism between nature and culture, objects and subjects that emerged during the Enlightenment by showing and discussing the agentic capabilities of non-human plants, animals, and things. One particular focus of the new-materialism-inspired archaeologies is the way everything things affected the people who used them and by extension, came to shape the social and material worlds these objects were a part of.

For instance, the one house site we excavated at Quarter Site B had evidence for a castiron stove (see Chapter 10). Rather than simply seeing this as an alternative to an open hearth, focusing on the stove's materiality and addressing how it shaped the world around it gives us a different perspective on enslaved life. Its physical qualities, specifically its construction from five solid cast iron plates, forced heat and light to move through the cabin in unique ways. The stove provided a more efficient way of heating the cabin than an open hearth by radiating heat indirectly through the cast-iron slabs. But having heated iron slabs in the tight confines of the cabin may have also led to burns if women, men, and especially children brushed up against the
stove. Given this, the stove may have forced enslaved people to move through the cabin in ways that gave it a wide berth. While open hearths let light spill out into a room, the stove's iron sides prevented firelight from exiting, limiting enslaved people's ability to see in the cabin at night ( N 1856), especially since nighttime was the only time most enslaved people spent in their homes between Monday and Saturday (B. Dew 1856, 52; Pauling 1836, 181; also see Morrison 2004, 31). As a result, the women and men living in the house needed to acquire lamps and lanterns to light the interior of the cabin. This is confirmed by our recovery of an abundance of lamp/lantern glass shards at the site. Indeed, from one cabin alone, 225 shards were identified. This density stands out when compared to the 245 shards of lamp/lantern glass found across seven households at Virginia's Montpelier plantation where open hearths were used (Trickett 2013a; 2013b; 2014).

The new materialism has the potential to reshape archaeology and the questions we ask, offering new ways to think about how the artifacts we study physically shaped the lives of enslaved women, children, and men. However, there has been a reluctance among archaeologists studying slavery (but see Schwalbe 2020) and the broader African diaspora (but see Arjona 2017a; 2017b; González-Tennant 2018), to take up these theories for three reasons. First, many archaeologists (e.g., Hodder 2012; Lucas 2012; Olsen 2010; Olsen et al. 2012; Witmore 2014) who use this literature focus on things (almost) to the point of excluding the people who made and used them (Fowles 2016). This is off-putting to anthropologically-trained archaeologists who approach the study of material traces as a way to learn about people (Cipolla 2017; 2018; 2019, 615; Fowles 2016; Van Dyke 2015; 2021). Second, enslavers defined enslaved women, children, and men as things, as property they could buy and sell, rape and maim (e.g., Césaire 1972, 42; Macharia 2019; Morrison 2019; Moten 2003; Spillers 1987). As a result, archaeologists are hesitant to latch onto theories that highlight things to avoid once again objectifying Black
humanities (e.g., McGuire 2021). What many critiques of the new materialism downplay, however, is that studying things and their agentic capacities to affect the world around them does not necessarily lead us to ignore people or reduce humans to objects (e.g., Khatchadourian 2016; Law Pezzarossi 2014; Novak and Warner-Smith 2020a; Fowler 2013; Fowles 2013; Pauketat 2013; Pezzarossi 2015a; 2015b; A. T. Smith 2015). Not only can we use the new materialism to study people, but these theories can lead to more nuanced studies of enslaved life by forcing us to grapple with the nutritional content of enslaved people's food (Chapter 6), heavy metals from ceramic glazes seeping into and affecting their bodies (Chapter 9), and how the rigidness of brick chimneys could prevent enslaved people from saving their home from a devastating house fire (Chapter 10). These provide details on enslaved people's diets and how their homes may have caught fire that we might not have otherwise, allowing us to tell better stories about what life was like for Black women, children, and men enslaved in the Americas. In other words, Assembling Enslaved Life explores the role food, market towns, ceramics, yard spaces, and cellars played in the politics through which enslaved Shenandoahans redefined themselves as human.

The third reason the new materialism is not widely used in archaeologies of enslaved life is that it is often seen at best as something that cannot "say anything useful about race," since "the most widely read texts... [in] this emerging field" (e.g., Barad 2007; Bennett 2010; DeLanda 2006; Deleuze and Guattari 1987; Ingold 2011; Latour 1993; 2005) "pointedly do not," and at worst as an attempt to move academic discourses "beyond race, and... blackness" (e.g., Byrd 2011; T. L. King 2017; Z. I. Jackson 2013; 2015, 216; 2020; López 2018, 372; Tuck 2010). Again, this critique does not apply to all new materialist-inspired works, as scholars are using these theories to directly address race (e.g., Allewaert 2013; Chen 2012; Conley 2017; Z. I. Jackson 2020; T. L. King 2019; Lans 2021; Leong 2016; M’charek 2013; Moten 2003; Murray

2007; Musser 2012; Puar 2017; Towns 2018; Weheliye 2014; Wells 2019; Yountae 2014), even if they (predominately scholars of color) remain segregated from the canonical works of the new materialism (predominately written by white scholars). These works provide a valuable template for thinking about the materiality of race, but it is important to note that they primarily deal with bodies and aesthetics, creating a gap between new materialism-inspired studies of race and new materialist-inspired archaeologies, which generally focus on the materiality of everyday life. This, however, is an easy gap to bridge, as it only requires applying the existing discussion about bodies and aesthetics to ceramics, food, houses, and landscapes, letting us see how mundane things (re)produce ideas about race, often through the embodies ways people can move through the word (see Ahmed 2007; Novak and Warner-Smith 2020b).

Once this intellectual bridge has been built, it is not a great stretch to extend this focus on the materialities of everyday life to counter-humanism's focus on the ontological politics waged over who counts as fully human. Much of this school of thought is focused on discourses about race, slavery, and humanity. What goes unacknowledged is that discourses are material, as they cannot occur without pen and paper, books and maps, computers and internet cables, soundwaves and larynxes (e.g., Watkins 2021). Furthermore, whips, chains, and the holds of slave ships were critical components of these conversations, physically enacting definitions of who could be whipped, chained, or locked in a suffocating hell and who could not (e.g., Leong 2016; Mustakeem 2016; Smallwood 2007; Spillers 1987; also see Deleuze and Guattari 1987, 80-81). This insight allows archaeologists to focus on the materiality of everyday life and consider how things such as ceramics and houses were part of the discourses through which the ontological politics of slavery were waged, and actively defined what it meant to be human and
who could gain access to this racialized ontological category instead of passively reflecting or symbolizing these discussions.

Making this connection is critical for archaeological studies of race. Race is not inherently biological but a series of discourses about human aesthetics that come to have material and biological effects (Benjamin 2018b; Gravlee 2009; Watkins 2021). Often, these effects map onto established racial categories, with those deemed to be white being affected differently than those deemed to be Black or Indigenous, which in turn reproduces these discussions. If we see these discourses as immaterial, and their material and biological effects as merely reflecting these larger discussions instead of actively reiterating them, then archaeology cannot contribute to the understanding of how ideas about race emerged or the ways racializing discourses repeat across time and space. Instead, we can only assess materials that symbolize or reflect the larger discourses swirling around the people we study. But if we see these discourses as materially constituted, as taking place in and through things as much as it does ideas, then artifacts and landscapes can be approached as components in the ontological politics of being that played out on American plantations, materially constituting who counted as human, who could be violently exploited, and who could accumulate profits from the flesh of another.

That all being said, Assembling Enslaved Life is highly theoretical. This is not (just) because I enjoy theoretical discussions. Rather, assemblage thinking, counter-humanism, and the new materialism let me tell better stories about enslaved life in the Shenandoah Valley than the existing theories archaeologists use to study slavery. A focus on assemblages highlights connections, and the ways the Valley's political economies both affected and were affected by enslaved women, children, and men. In other words, it provides a better way of seeing how Black lives mattered in the Valley by emphasizing enslaved Shenandoahans as historical actors
and tracing the effects that radiated out from the ways they built lives for themselves. Counterhumanism focuses on the politics of local political economies, specifically the ontological politics that enslavers and the enslaved waged in the Valley. This demonstrates that Valley enslavers inflicted the same types of ontological violence onto enslaved people we see throughout the Americas, while at the same time providing a more expansive understanding of what enslaved women, children, and men faced and the full range of strategies they used to make lives for themselves. To put it another way, counter-humanism helps us think about the ways Black lives were made to matter less than white lives in the Shenandoah Valley and how these discourses were contested. Finally, the new materialism lets me focus on the role everyday things played in these politics, showing how enslavers enacted their definitions of humanity using bricks, farm implements, and corn, how enslaved people used plants, animals, quartz crystals, and ceramics to make their own definitions of humanity, and how the physical properties of these materials could (inadvertently) undermine the discourses they contributed to.

Finally, the pages that follow are heavily indebted to Black studies. Without these works, this would be a very different dissertation. But I also intend Assembling Enslaved Lives to give something back to Black studies. In recent years, the method of critical fabulation, popularized by Saidiya Hartman (2008), has become commonplace in Black studies. This approach "play[s] with and rearrang[es]" the "elements" of stories from the archives of slavery to "re-present... the sequence of events," highlighting "contested points of view" that "displace the received or authorized account, and... imagine what might have happened or what might have been said or might have been done" (Hartman 2008, 11-12). This is far from an ideal way of studying history, as it uses carefully crafted "fictions" to fill in the gaps and silences of the historical record. But if we are relying solely on written documents to learn about enslaved lives, it is a
necessary way of studying the past. This is where archaeology can play an important role in Black studies. The archaeological record forms an alternative archive that can provide missing details about enslaved life. It is imperfect, with its own gaps and silences, and with its own issues when it comes to humanizing the past. It is an incredibly intimate archive, full of things people touched every day but we often lack the ability to put a name or a face to these women, children, and men. But if critical fabulation is a way of going beyond the limits of the archive, combining written sources with the archaeological record can at least extend that boundary by letting researchers use new sources that can be integrated into critical fabulations. Assembling Enslaved Lives is an attempt to map out this new border, to show where the new starting point for critical fabulation might be if archaeologists begin contributing to the intellectual project of Black studies.

Before continuing, it is important to make two comments on the language used in Assembling Enslaved Lives. First, I use "enslaved" (instead of slave or bondspeople) to refer to Black women, children, and men enslaved in the Shenandoah Valley and "enslaver" (instead of master, mistress, slaveholder, or slaveowner) to refer to the women and men who did this enslaving. I do this because both are becoming the preferred terms for these two groups of people (e.g., Browning-Mullis 2020; P. G. Forman 2022; National Park Service 2022;

Underground Railroad Education Center 2020). Using enslaved is already widely accepted, but enslaver is not as common. However, it is a particularly pertinent term for this project because it fits with my use of assemblage thinking. Compared to "enslaver" the terms slaveholder or slaveowner are static, implying a set condition of owning someone who has been made to be a slave, or of holding someone in that position after they have been enslaved. In other words, both position the act of enslaving as something that has already been done. Enslaver, alternatively, is a
more active word that shows the act of enslaving as a continual process, one that had to be materially enacted through a constant series of mundane practices (e.g., Hartman 1997; Ingold and Hallam 2014). It also does a better job of highlighting enslavers' "complicity and active participation in upholding and perpetuating... violent oppression" (Underground Railroad Education Center 2020) and the fact that they could have ended slavery for anyone they enslaved at any point in time. However, the one downside with enslaver is it names a wider variety of people than a term like slave-owner. Overseers, judges, police constables, and merchants could all be enslavers if their actions helped to enslave someone, even if they did claim this person as their property. Therefore, I use enslaver specifically when referring to those people who made these claims, not to everyone complicit in enslaving Black women, children, and men in the Shenandoah Valley.

Second, I use "white" to refer to people of European descent. In $18{ }^{\text {th }}$ - and $19^{\text {th }}$-century America, whiteness was simultaneously defined in multiple ways. Among people of European descent, only people from certain ethnic groups and economic standings could claim to be white, creating an understanding of whiteness that otherized immigrants and the poor. We see this most iconically with the Irish, who were not considered white well into the $19^{\text {th }}$ century (e.g., Ignatiev 1995; Roediger 1991). At the same time, census officials identified Irish immigrants as white, as did local courts, since legal statutes often meted out different punishments for the same offense to white and Black people, and Irish lawbreakers were always included in the former category (e.g., Common Council 1856). Perhaps more importantly, an Irish immigrant could not be enslaved. This definition of whiteness otherized people of African descent. I use this latter definition of whiteness in Assembling Enslaved Lives because it directly relates to notions of Blackness that underwrote the institution of slavery. This overlooks important aspects of
whiteness and the way people Euro-descended Shenandoahans actively laid claim to this racial classification - which need to be studied but which are far beyond the scope of my dissertation. What my framing does provide is a focus on how these racial classifications articulated with and worked to advance the power relations of slavery and the legal mechanisms through which the institution operated. However, throughout the text I attempt to introduce some nuance into the category of "white Shenandoah" by looking at both enslavers and non-enslavers, and by focusing on the various occupations of non-enslaving people of European descent whenever possible.

## What is to Come

Assembling Enslaved Lives is divided into two sections. The first (Chapters 1-4) provides historical background and the theoretical framework for the dissertation. Chapter 1 (The "Demonic Grounds" of Valley History) gives a history of the Shenandoah Valley and uses Sylvia Wynter's concept of "demonic grounds" to provide a critical assessment of how historians have treated slavery in the Valley. I demonstrate the strategies scholars used to erase slavery from local histories, and how the few works on Valley slavery have approached the institution as a homogenized whole instead of studying the lives of enslaved Shenandoahans. The historical background continues in Chapter 4 (Belle Grove Plantation), which presents the history of Belle Grove Plantation and the archaeological excavations I directed at the property's main quartering site (Quarter Site B). Chapters 2 and 3 provide the dissertation's theoretical framework. Chapter 2 (Thinking with Assemblages) covers assemblage thinking, discussing the foundational concepts of this school of thought and how we can use it as a framing device for archaeological and historical research. Chapter 3 (The Ontological Politics of Enslaved Life) discusses counterhumanism, how we can combine it with the new materialism, and what a counter-humanist study of slavery looks like.

My study of enslaved life in the Shenandoah Valley is presented in the second section (Chapters 5-10). Instead of the more traditional approach to archaeological dissertations, which have three or four analysis chapters focused on particular themes, I opted to have six analysis chapters, each focusing on a different "thing" that affected the lives of enslaved Shenandoahans (also see Tsing 2015, viii). This structure helps me emphasize materiality by looking at how different types of things affected enslaved people in unique ways while also providing ways for enslaved women and men to affect the world around them.

This begins with two chapters on the labor that shaped enslaved Shenandoahans' lives. Chapter 5 (Grain) discusses grains - the primary cash crops in the Shenandoah Valley. Using written sources, this chapter documents how planting and harvesting wheat, rye, oats, and corn shaped enslaved farmers' yearly cycle. Enslaved men and women worked together in the fields, and I argue that forcing Black women to perform fieldwork was one way enslavers defined enslaved women as differently human. Using ledgers from Valley mills, this chapter also shows that enslaved farmers planted and harvested much of the grains grown in the Shenandoah Valley, with their labor driving the local economy even if they were not allowed to reap the benefits of their work. Finally, this chapter ends by assessing how fluctuations in the flour market influenced enslavers' decisions to buy or sell enslaved women, children, and men - choices that profoundly affected enslaved life in the Valley. Chapter 6 (Hunger) focuses on the role of hunger in the ontological politics of slavery. Enslavers did not give enslaved people nearly enough food. Building on the discussion of labor in Chapter 5, we can see that the food enslaved people were issued was often hundreds, if not thousands of calories below what they needed to perform agricultural labor. Using discussions in $19^{\text {th }}$-century agricultural journals, I demonstrate that enslavers justified this by arguing that enslaved people had different biological needs than white

Americans, thereby defining Black people as differently human, and arguing that enslaved people were interchangeable (or fungible), with different people needing the same amount of food regardless of body size or metabolism. Enslaved people, however, actively pushed back against this and redefined themselves as people who could not survive on limited rations by doing whatever they could to get extra food. At Belle Grove, enslaved women and men did this by growing extra food, raising poultry, gathering wild plants, fishing, and hunting. Their actions created a series of effects that shaped local political economies, from enslavers perversely using the extra food enslaved people got for themselves to argue that the rations they issued were sufficient to enslaved people selling corn and eggs.

Chapters 7-9 focus on enslaved people's consumption practices, and how they used the things they acquired from local merchants. Chapter 7 (Cities, Towns, and Country Stores) continues where Chapter 6 leaves off with an intensive discussion of enslaved people's ability to participate in local markets, and how increasing restrictions throughout the $19^{\text {th }}$ century limited their ability to buy and sell things in cities, towns, and country stores. The chapter opens with a discussion of the restrictions on enslaved people's ability to participate in local economies that enslavers introduced from the 1790s into the 1850s, and how these were fueled by discourses that argued enslaved people's consumption practices were chaotic. The rest of the chapter uses data from merchants' ledgers and ceramics from Quarter Site B to demonstrate that these restrictions impacted enslaved people's ability to travel to and trade in cities, towns, and country stores. In Chapters 8 and 9, I continue to analyze the ceramics using written sources, residue analysis, and use-wear analysis. Chapter 8 (Imported Tea and Tablewares) focuses on how enslaved women and men at Belle Grove used imported tea and tablewares, demonstrating that they had their own conceptions about how these vessels should be used, frequently eating food
from tea saucers, and occasionally using mugs and teacups in the same way. Tea wares were important vessels for creating and enacting the definition of humanity enslavers claimed for themselves, and enslaved people using these ceramics in their own ways suggests that they acquired tea wares not to lay claim to enslavers' definitions of humanity but to create ways of eating meals that lay outside of these racialized logics. Chapter 9 (Locally-Made Utilitarian Ceramics) focuses on locally-made utilitarian wares, demonstrating that enslaved people used crocks and jugs for storing food and milk pans as cooking pots. This chapter also demonstrates how enslaved consumers affected the Shenandoah Valley's ceramic industry when they bought locally-made vessels.

Chapters 8 and 9 also continue the discussions of food that began in Chapter 6. Chapter 8 returns to the discussion of enslavers' insistence that the same amount of food was sufficient for every enslaved woman and man, suggesting that the use of tea wares as bowls, which were the cheapest decorated vessels available to enslaved people, was one way they defined themselves as individuals, allowing them to eat food from vessels with different decorative motifs. Chapter 9 introduces the importance of temporality to the ontological politics of food, arguing that some of the strategies enslaved people used to redefine their humanities on foods that were not available year-round and animals that needed to be preserved after slaughtering. Because of this, ceramic crocks and jars allowed enslaved women and men to pickle and preserve food for the winter when fresh produce was unavailable, and their ability to redress the hunger imposed on them was otherwise diminished.

Chapter 10 (Brick Chimneys) addresses the landscapes of slavery in the Shenandoah Valley by focusing on the layout of Belle Grove Plantation. Using the arrangement of buildings on the landscape, I demonstrate that the Hite family, who owned Belle Grove, created a highly
organized landscape as a way of defining themselves as fully human. The Hites used building materials to racialize the landscape around them. Those people classified as "white" at Belle Grove lived in houses with stone structural elements; enslaved women, children, and men, all defined as "Black," inhabited the only buildings with brick elements, particularly brick chimneys. Enslaved people at the quartering site, alternatively, created their own understandings of how this landscape should be organized that fit their needs. They created their own definitions of humanity using quartz crystals to ward off spirits, and brooms to create yard spaces where they could cook and socialize. In closing, I discuss a fire that started in the brick chimney of House Site 1, which we excavated in 2017-2019. Once the fire began, I argue, the physical properties of the bricks and mortar that the Hites used to racialize the dwelling's inhabitants prevented them from removing the chimney from the house, ensuring that the building went up in flames.

Finally, the conclusion to Assembling Enslaved Life addresses the next steps for this research, both in terms of how we can take this new information about enslaved life in the Shenandoah Valley and use it to tell more inclusive histories of the region, and in terms of where we might go next with the counter-humanist theories that drive much of my research.

## Chapter 1: The "Demonic Grounds" of Valley History

Writing has nothing to do with signifying. It has to do with surveying, mapping, even realms that are yet to come.
(Deleuze and Guattari 1987, 4-5)
If you flip through a stack of books on the history of the Shenandoah Valley, two trends quickly become apparent. First, most Valley historians are interested in the early colonial era (1732-1763) and/or the American Civil War (1861-1865). Second, most scholars have equated Valley history writ large with the history of white Shenandoahans, especially those of German and Scotch-Irish descent. Yet, in the century between the early colonial era and the start of the Civil War slavery thrived in the Valley, with enslaved people accounting for around 20\% of the region's population (Figure 2). With few exceptions (Denkler 2010; 2020; Hofstra 1999; Koons and Hofstra 2000; McCleskey 2014; Noyalas 2021), you will not find discussions of slavery in our hypothetical stack of books.

To theorize the removal of Black lives from Valley histories I find it helpful to turn to Sylvia Wynter's discussions of "demonic grounds" (1987; 1990; also see Flewellen 2017; McKittrick 2006). Drawing on the use of demonic models in mathematics and physics, Wynter defines demonic grounds as ontological positions rendered "outside of our present governing system of meaning," making them unknowable/unimaginable from within the "mode[s] of being/feeling/knowing" that support these systems (Wynter 1987, 219; 1990, 356, 364). As a result, the process of becoming-demonic dehistoricizes and despatializes certain groups of people in ways that allow them to be placed outside of time and space, where their existence (if recognized at all) need not be explained in any detail. By placing enslaved life in the demonic

Figure 2. Demographics of Slavery in the Shenandoah Valley, 1800-1860. Image by Author.
grounds of Valley history, white scholars made it unimaginable to see enslaved Shenandoahans as historical actors, as people whose lives could have mattered. This allowed the Valley to become, at least to white scholars and those who read their works, a region built by white Americans for white Americans.

Assembling Enslaved Lives rejects this treatment of enslaved Shenandoahans and attempts to dismantle the demonic grounds of Valley history so we can see how Black women, children, and men affected, and were affected by, the region's political economies. But first, we must understand what we are dealing with. This chapter engages with the historiography of the Shenandoah Valley in two ways. First, I lay out a conventional history of the region that covers the initial settlement of the Valley, its integration into $18^{\text {th }}$-century trans-Atlantic economies, its
growing prosperity and eventual economic downturn in the $19^{\text {th }}$ century, and the varied ethnic and religious makeup of white Shenandoahans. This sketches out the region's political economies while demonstrating major trends in Valley histories. Second, I discuss how scholars have engaged with enslaved life, the ways they (un)intentionally left enslaved people out of the history of the Shenandoah Valley, and how this has affected our understanding of the region.

## A Conventional History of the Valley, 1730 to 1860

This [is] the version of history taught by the forces that upheld the Plantation. (Wynter 1971, 96)

Between 1607 and 1715, the Blue Ridge Mountains formed an impenetrable wall that protected Virginia and its profitable tobacco plantations, keeping French forces from entering and enslaved people from leaving the colony. In 1716, however, colonial rangers located a pass through the mountains, transforming the Blue Ridge into a porous border overnight. Growing anxiety about this pass and several others found in the following years led Virginia's governor to incorporate the Shenandoah Valley - located just across the mountains - into larger colonial projects in the 1720s. These plans focused on replacing the now-obsolete natural boundary of the Blue Ridge with a new human border, composed of white colonizers who would become the first line of defense in the event of a French invasion and prevent the establishment of maroon communities in the Valley (Hofstra 1998; 2004, 5-7).

To implement these plans, Virginia granted large tracts of land to select individuals on the condition they settle one family for every 1,000 acres they acquired. In the southern Valley, this began with a 20,000-acre grant to Jacob Stover in 1730, followed by grants to William

Figure 3. County Boundaries. Map by Author.

Beverly (118,491 acres) and Benjamin Borden (92,100 acres) (Mitchell 1977, 31). In the northern Valley, John and Isaac van Meter acquired 40,000 acres in 1730, which they sold to Jost Hite in August 1731. Hite and his partner Alexander Ross quickly acquired an additional 100,000 acres and moved to this land by late summer or early fall 1731, settling 16 families between the Potomac River and Cedar Creek. To fulfill the requirements of these grants, Hite and Ross actively recruited colonists in Pennsylvania, quickly bringing 100 families into the Valley (Hofstra 1990, 108; 2004, 34; Mitchell 1977, 29). By 1738 enough people lived in the Valley for the colonial government to establish two counties in the region (Figure 3) - Frederick County in the north and Augusta County in the south - with seven additional counties emerging from the two by 1836 (Mitchell 1977, 11). Settlement in the Shenandoah Valley proceeded rapidly, with over 18,000 people inhabiting the region by 1755 (Mitchell 1977, 96). By 1800, the population had increased fivefold, with $66 \%$ of Shenandoahans living in the northern Valley (see Figure 2).

Three factors attracted early colonists to the region. The first was large tracts of affordable land created by the land grants. Second, the Valley lacked a significant Native American presence, allowing colonists to claim the territory with relative ease (Mitchell 1977, 16). While Virginia Indians lived in the Valley for thousands of years, biological and political shockwaves created by European colonization disrupted the lives of Native Shenandoahans, many of whom left the region by the mid- $17^{\text {th }}$ century (Barber and Barfield 1997; Gardner 1989; Hantman 2004, 30; Hofstra 2004; McConnell 2010). The Iroquois Confederation soon laid claim to the largely depopulated Valley, using it as a thoroughfare for war parties moving between the Northeast and the Carolinas (Hofstra 2004; McConnell 2010). This use of the Valley continued through the first few decades of European colonization without major disruptions to colonists. However, there are sourcing indicating some continued Native inhabitation of the Valley through the late- $18^{\text {th }}$ century, even if their presence has also been rendered demonic in most Valley histories. Third, most of the Shenandoah Valley contains rich, silty topsoil which, in combination with easy access to streams and an annual rainfall of 35 " to 38 " made the region exceptionally fertile (Hofstra and Geier 2000; Raitz 2010, 43-44).

This fertility allowed mixed farming to thrive in the Valley, with colonists growing wheat, rye, barley, oats, corn, flax, hay, and truck vegetables to feed themselves and the pigs, cows, and sheep they raised (Hofstra 2004, 204-17; Mitchell 1977, 134-38). During the first generation of colonization, farmers produced little surplus (Hofstra 2004, 197-217). However, this changed during the Seven Years War (1756-1763) and the establishment of Fort Loudon in Winchester (Frederick County), which served as an important post for defending the Virginia backcountry and a launching off point for invasions into western Pennsylvania. Once British and colonial forces arrived in the Valley, army quartermasters started buying food from local farmers
(Mitchell 1977, 144-47). By the time hostilities ceased, most farmers were selling approximately $25 \%$ of their crops. After losing the military market in 1763, Shenandoahans sold agricultural products to merchants in Philadelphia and eastern Virginia (Mitchell 1977, 152).

With these new trade relationships established, the late- $18^{\text {th }}$ century saw increased agricultural production in the Valley. This occurred at a rather fortunate time for local farmers. A generation earlier, England produced enough wheat to meet its own needs and supply southern Europe, where population growth and poor harvests produced a growing demand for imported foodstuffs (Hofstra 2004, 274; J. D. Majewski 2000, 146). Yet, by the mid-to-late-18 ${ }^{\text {th }}$ century, an ever-increasing population and the rise of the industrial revolution and urbanization prevented England from producing enough food to meet local demands, let alone export grain to other parts of Europe. As a result, the price of flour doubled between 1740 and 1770 (Clemens 1980, 17677). Colonial merchants quickly capitalized on the need for grain, extending lines of credit throughout the Valley to further draw the region into the trans-Atlantic flour trade (Hofstra 2004, $10,274)$. Most of the wheat grown in the Valley during the late 1760 s and early 1770s was sold to merchants in Alexandria, Falmouth, or Fredericksburg (all located in eastern Virginia), and shipped to England and the Caribbean. The Caribbean trade was especially important for Valley farmers. Wheat varieties grown in England and the northern colonies had a high water content, causing them to quickly spoil in the humid Caribbean (Rood 2014, 25; Sharrer 1982, 139). Farmers in Virginia and Maryland, however, primarily grew soft red winter wheat which had a lower water content, letting it last for months in the Caribbean. As a result, merchants in Virginia and Baltimore, Maryland dominated the Caribbean flour trade.

The American Revolution (1776-1783) briefly interrupted the Valley's flour trade. At the war's end, Britain tried to cut the United States out of the Atlantic grain trade, but poor harvests
kept the United Kingdom from feeding itself. As a result, trade with Britain and its Caribbean colonies was quickly reestablished (Sharrer 1982, 140-41). Crop failures and unrest in Europe further increased the demand for Valley flour in the late 1780s and 1790s, with local farmers increasing their exports from 2 million pounds in 1783 to 14 million pounds in 1800, making it Virginia's leading producer of flour (Fischer 1996, 142, 152; Mitchell 1977, 171-77).

Although not as lucrative as flour, the cattle trade played an important role in the Valley's economy (Brown and Sorrells 2004; McMaster 1990; Mitchell 1977, 183-85; Sorrells 2005). This trade originated in the mid- $18^{\text {th }}$ century with drovers from North Carolina and southwest Virginia moving cattle northward through the Valley toward Philadelphia, buying steers along the way (McMaster 1990, 130-31). By the 1760s, some Valley farmers were raising large herds to sell to drovers (McMaster 1990, 133, 136). To increase profits, they began importing English bulls to improve local stock and using feedlots to supply animals with corn and hay throughout the winter to prevent them from losing weight (McMaster 1990, 143-46; Sorrells 2005, 52). By 1800, the Valley dominated Virginia's cattle trade.

Other industries related to agro-capitalism soon emerged in the Valley. Chief amongst these were mills, which transformed wheat and other grains into flour and meal (Hofstra and Geier 2000). Many millers also operated sawmills, allowing farmers to create sellable lumber from the trees they felled while clearing fields. To increase the value of locally grown rye and corn, many farmers distilled whiskey and unaged spirits. Textile mills, linseed mills, and tanneries also processed wool, linen, hemp, and hides (Keller 1990a; Mitchell 1977, 207).

While rivers provided the primary means of transportation in eastern Virginia, much of the Valley lacks access to navigable waterways, forcing trade to move along roads. Throughout the Colonial and Antebellum eras, the Great Wagon Road served as the principal thoroughfare in
the region, running the length of the Valley, and extending northward toward Philadelphia and southward toward contemporary Roanoke where it connected to roads leading into North Carolina (Hofstra and Raitz 2010; Rouse 1973). During the mid-18 ${ }^{\text {th }}$ century, newly constructed roads connected the Valley with Alexandria, Fredericksburg, and Richmond. By 1800 six roads in the northern Valley and three roads in the southern Valley crossed the Blue Ridge, facilitating the ever-increasing movement of commercial products into and out of the region (Hart 1942, 149-52; Mitchell 1977, 153, 190-91). Given the importance of wagons to local trade, many men made a living serving as wagoners, and several towns, including Newtown (modern-day Stephens City), profited from the construction of wagons and carts.

Following typical settlement patterns in Virginia, the initial colonization of the Shenandoah Valley took place without the establishment of towns or villages. Instead, colonists lived in sprawling rural neighborhoods that stretched for miles, meeting at taverns and homes to conduct business. In 1738, the colonial government granted a charter for Winchester, the region's first town. Despite serving as the seat of Frederick County, Winchester remained on the periphery of the region's economy until 1756 when it was selected as the location for Fort Loudon (Hofstra 2004, 235-56). As the Valley's wheat and cattle trades started moving through Winchester, and soldiers sought out businesses to spend their pay, the town quickly became the central hub for local trade. Other towns emerged during the third quarter of the $18^{\text {th }}$ century, including Shepherdstown, located 25 miles northeast of Winchester, and Newtown, Strasburg, and Woodstock, each located approximately a day's travel from one another, stretching southwest from Winchester along the Great Wagon Road (Hofstra 2004, 261-64).

The wealth generated by the Shenandoah Valley's political economies did not spread evenly throughout the region. The northern Valley had a larger population than the southern

Valley. It produced more agricultural products and had closer ties with merchants in Philadelphia and eastern Virginia (Mitchell 1977). Not surprisingly, it profited more from the growing trade with the eastern seaboard. Within the northern Valley, a select few families in eastern Berkeley and Frederick Counties (modern-day Jefferson and Clarke Counties, respectively) accumulated most of the money pouring into the northern Valley while half the taxable population in Frederick County did not own land (Mitchell 1977, 120; Tillson 1991). Many of these families emigrated from eastern Virginia or were absentee landholders primarily residing across the Blue Ridge. Despite this, many middling families in the northern Valley prospered from selling flour and other agricultural products.

A World Made By Wheat: Prosperity and Decline (1800-1860)
The Shenandoah Valley remained the center of wheat production in Virginia throughout the early- $19^{\text {th }}$ century, eventually becoming the largest exporter of flour in the American South. This prosperity led observers to declare the Valley a "world made by wheat" and the "most bountiful portion of our country" (Hofstra and Koons 2000, xix; Keller 2000, 5-6). Between 1800 and 1815, exports to Britain were sporadic, primarily occurring in years when British farmers failed to produce enough food for the growing urban population (Galpin 1927). The Caribbean continued to be a reliable consumer of Valley grain, taking in $33.31 \%$ of all flour and $34.53 \%$ of all corn exported from Alexandria (Table 1). However, once the Peninsula War (1807-1815) disrupted agriculture in Spain and Portugal, they became the most important markets for US grain.

The $19^{\text {th }}$ century saw the Shenandoah Valley become increasingly connected to the outside world through new transportation networks. A series of canals allowed farmers in the

Table 1. Amount of flour, corn, and wheat exported from Alexandria, by destination, 1801-1815. Data from Galpin (1927).

| Location | Flour <br> (Barrels) | Flour <br> Percent | Corn <br> (Bushels) | Corn <br> Percent | Wheat <br> (Bushels) | Wheat <br> Percent |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| West Indies | 380,051 | $33.3 \%$ | 204,748 | $34.5 \%$ | 6,892 | $2.1 \%$ |
| Iberia | 589,352 | $51.7 \%$ | 364,492 | $61.5 \%$ | 261,397 | $80.7 \%$ |
| United Kingdom | 150,516 | $13.2 \%$ | 12,976 | $2.2 \%$ | 55,631 | $17.2 \%$ |
| South America | 18,005 | $1.6 \%$ | 7,660 | $1.3 \%$ | 0 | $0.0 \%$ |
| Canada | 3,011 | $0.3 \%$ | 3,079 | $0.5 \%$ | 0 | $0.0 \%$ |

southern Valley to ship wheat directly to Richmond using the James River by 1789 and a similar series of canals allowed goods to flow from Harpers Ferry to Alexandria by 1802 (Raitz 2010, 50). This made Alexandria the primary market for the northern Valley's wheat into the 1820s, a role it attempted to retain with the construction of the Chesapeake and Ohio Canal, which reached Harpers Ferry in 1834 (Fennell 2017, 52, 82; Keller 2000). To get goods to these canals, some farmers floated barrels of flour down the Shenandoah River on flat-bottomed boats while others used the Great Wagon Road (Bruggmean 2010; Raitz 2010, 49-50). In 1834 construction began on the Valley Turnpike, a macadamized toll road that connected Winchester to Staunton (Augusta County), allowing goods to move quickly through the region (Keller 2010; Lanier 2010, 129). Around this time railroad networks extended into the Valley, with the Baltimore and Ohio Railroad reaching Harpers Ferry in 1834, the Winchester and Potomac Railroad connecting Harpers Ferry to Winchester in 1837, and the Manassas Gap Railroad connecting Alexandria to Woodstock in 1856 (Dilts 1996; Longenecker 2002, 84).

In addition to serving as a conduit for wheat, merchants hoped the canal systems that flowed toward Alexandria would facilitate the movement of mass-produced commodities into the Shenandoah Valley, transforming the region into a "great emporium" (Fennell 2017, 37-40). By this time, however, three generations of Shenandoahans had relied on trade with Philadelphia,

Figure 4. Average of Price of Flour per Year in Alexandria, Virginia (1807-1860). Price is per barrel of superfine flour, and all prices are normalized to the value of the dollar in 1810. Data used in this figure is available in Appendix D, Table 10.
and many local merchants continued to stock their shelves with Philadelphian wares well into the $19^{\text {th }}$ century (Fennell 2017; Hofstra 2010, 98). Baltimore merchants played an increasingly important role in supplying goods to the Valley in the $19^{\text {th }}$ century as new transportation networks allowed them to cheaply move wares to local merchants (Fennell 2017; Hofstra 2004, 310). Many New England peddlers also operated in the Valley, further diminishing Alexandria's importance (Rainer 2000).

In 1815 Valley farmers lost their access to the profitable European markets as Iberian farmers replanted after the Napoleonic Wars and Brittan attempted to strengthen its economy by placing heavy tariffs on flour imported from the US (Keller 2000, 25). Making matters worse, the Panic of 1819 plunged the US into a two-year recession, dropping flour prices by $42 \%$
(Figure 4) (Haulman 2008). Yet, Valley farmers soon prospered again. In the 1820s, enslavers in
and around Rio de Janeiro, Brazil developed an insatiable appetite for wheat bread (Rutter 1897; Sharrer 1982). The Valley's soft red winter wheat was ideally suited for Brazil's humidity, and merchants in Baltimore started shipping Valley flour to Brazil. Baltimore soon became the leading supplier of flour to Brazil and the second biggest exporter of flour in the US between the late 1820s and the 1840s (Rutter 1897; Sharrer 1982). Merchants in Alexandria and Georgetown (Washington D.C.) increased flour prices to compete with Baltimore for Valley flour, but Baltimore's railroads and its control of the Brazilian trade made it the predominant market for Valley wheat by the 1830s, (Fennell 2017; Keller 2000, 24). However, some Valley farmers continued shipping flour along the Potomac River to Alexandria and to Georgetown (Washington D.C.) which dominated the Potomac River market after the 1820s (Comp 1978).

In the 1840s millers in Richmond, Virginia started producing a superior flour that quickly took over the Brazilian market (Rood 2014; 2017). As a result, plantations around Richmond switched from tobacco to wheat, with 10 counties around Richmond increasing their wheat production by over $200 \%$ between 1840 and 1860 (Figure 5). To keep control of the Brazilian trade, Richmond's millers obsessed over the quality of wheat they used, and many were reluctant to buy wheat from the southern Valley (Rood 2014, 38). Farmers in the northern Valley, who lacked direct access to Richmond even if they could find buyers, continued shipping their products to Baltimore, Alexandria, and Georgetown. Unfortunately, this was not a good time to be reliant on these markets. In addition to losing the Brazilian trade to Richmond, Baltimore lost its lucrative trade to the British Caribbean as flour consumption declined after emancipation in 1834. British markets opened back up to US imports in 1846, but New York City dominated this

Figure 5. Wheat production in Virginia and Maryland, 1840-1860. Top left: Wheat production by county, 1840. Top Right: Wheat production by county, 1850. Bottom left: Wheat production by county, 1860. Bottom left: Percent increase/decrease of the value of wheat crops relative to total value of agricultural products between 1840 and 1860. While the first three maps chart out changes in overall wheat production over time, the final map shows that the relative importance of wheat broadly decreased in the Valley and increased in eastern Virginia. Data from Agricultural Censuses available at IPUMS National Historical Geographic Information System: Version 15.0 (Manson et al, 2020), and is presented in Appendix A, Tables 1-3.
trade and the growing trade in grains to the increasingly urban Northeast (Sharrer 1982). By the 1850s, Baltimore was only exporting around $6 \%$ of the nation's flour (American Farmer 1858). ${ }^{1}$

These same factors affected Alexandria and Georgetown, where merchants bought and exported less flour throughout the 1840s and 1850s (Comp 1978). Making matters worse, the 1850 s also saw drought, wheat rust, and "unprecedented" insect infestations in the Valley, causing a $19.47 \%$ drop in wheat production (Figures 5 and 6) (Keller 2000, 29). Many Valley farmers moved to the

Midwest at this time.
Despite the outsized role flour played in the local economy, cattle continued to be an important source of income for Valley farmers, with droves of up to 12,000 steers passing

[^0]

Figure 6. Percent increase/decrease in wheat production in Virginia and Maryland, 1850-1860. This shows the decrease in Valley wheat production during the 1850s. Data from Agricultural Censuses available at IPUMS National Historical Geographic Information System: Version 15.0 (Manson et al, 2020), and is presented in Appendix A, Tables 2-3.
through Winchester by 1820 (Koons 2000b, 4). Most farmers also continued to plant corn, rye, and oats, much of which was fed to cattle in feedlots or distilled into whiskey. Rockbridge County alone produced 61,000 gallons of whiskey in 1850, and an even more impressive 97,000 gallons ten years later, much of which made its way eastward (Koons 2000b, 4). As with the $18^{\text {th }}$ century, gristmills, sawmills, textile mills, linseed mills, and tanneries processed agricultural products into exportable commodities.

## A Patchwork of People: Ethnic and Religious Identities in the Valley

While the previous sections focused on the Shenandoah Valley's political economies, these did not operate on their own. In this section, we meet the patchwork of people whose lives shaped, and were shaped by these forces - or at least those people most historians have focused on. While a variety of people colonized the Shenandoah Valley, the region is most often associated with people of German and Scotch-Irish descent. In the early- $18^{\text {th }}$ century, some

100,000 Germans, including Jost Hite (the land speculator introduced earlier), emigrated to British America, primarily disembarking in Pennsylvania (Fischer and Kelly 2000, 112). When recruiting the 140 families needed to fulfill his land grants, Hite heavily recruited within German communities, bringing dozens of Germans into the Valley, many of whom settled in what would become Rockingham, Shenandoah, and Frederick Counties (Comstock 1994a, 8; Fischer and Kelly 2000, 113; Wayland 1907; Wust 1969). Hite's partner, Alexander Ross, was of ScotchIrish descent. Scotch-Irish emigrated from southern Scotland and northern England to northern Ireland in the $17^{\text {th }}$ century to assist colonial efforts on the island before immigrating to British America in large numbers between 1717 and 1775 (Fischer 1989). Many Scotch-Irish first arrived in Pennsylvania, where they formed connections with German immigrants (Keller 1990b, 72) - such as the partnership Ross forged with Hite. In addition to recruiting Germans, Hite and Ross brought numerous Scotch-Irish families into the northern Shenandoah Valley, while many more passed through this area to settle in the southern half of the region (Katherine L. Brown and Keller 2012; Comstock 1994a, 8; Fischer and Kelly 2000, 126; Mitchell 1977, 104). English colonists also migrated to the Valley from Pennsylvania and eastern Virginia (Comstock 1994a, 8; Hofstra 1990; Mitchell 1977, 35).

In the Valley, German and Scotch-Irish families generally settled next to one another in multi-ethnic rural neighborhoods (Hofstra 2004; 2012). Scotch-Irish men generally took control of local politics, a move fueled in part by the desires of politicians of English descent in eastern Virginia who preferred to deal with people of British heritage (Hart 1942, 58, 65; Hofstra 2004; Keller 1990b). Some (e.g., Keller 1990b) argue that a Scotch-Irish ethnic identity did not exist in the colonial backcountry, with people instead identifying themselves by where they lived and the religion they practiced (see below).

German families, however, performed ethnic identities into the 1830s, with many speaking German and reading German-language newspapers (Dolmetsch 1984; Fennell 2017, 124; Edmonds 1936; Linebaugh 1998, 202; Mitchell 1977, 107). ${ }^{2}$ German-trained potters supplied the region with earthenwares and stonewares between 1745 and 1900 (see Chapter 9) (e.g., Comstock 1994a; Evans and Suter 2004; Jolley 2004; Kaufman 1978; A. H. Rice and Stoudt 1929; Russ 1995; Russ and McDaniel 1986; 1991b; Wiltshire 1975). Purchasing these vessels and using them to prepare traditional foods let families perform German identities (Fennell 2017; Fischer and Kelly 2000, 114; Gibb 2007; Gibb and Pettit 1997). Germans also brought distinctive architectural traditions to the Valley, and while the homes they built were not identical to those they left in Europe (Roberts 1986; W. W. Weaver 1986), they retained many key features (Chappell 1986; Fennell 2017, 139-47; Hofstra 2004, 35-36; Kniffen and Glassie 1966).

In the $18^{\text {th }}$ century, Scotch-Irish people tended to practice Presbyterianism, while most Germans belonged to Lutheran, Reformed, Dunker, Mennonite, or Quaker congregations (Fennell 2017, 124; Longenecker 2002, 23-26; Mitchell 1977, 105). Shenandoahans of English descent belonged to Baptist, Anglican, or Quaker churches/meeting houses (Comstock 1994a, 67; Longenecker 2002, 28). While most scholars focus on ethnicity, religious affiliation was often the main way Shenandoahans self-identified (Longenecker 2002). However, given the entanglements between religious affiliation and ethnicity, religion often reinforced ethnic identities. For instance, many of the German-language presses operating into the $19^{\text {th }}$ century

[^1]specifically catered to Lutherans (Edmonds 1936; Longenecker 2002, 74), allowing religious affiliation to inadvertently perpetuate ethnolinguistic practices.

The $19^{\text {th }}$ century saw the unraveling of many previously distinct identities in the Shenandoah Valley and the emergence of new identities that united the region's white population. We can attribute this to three trends. First, as Scotch-Irish people interacted with Germans, many started buying and using locally made ceramics and building German-style homes for themselves (Fennell 2017, 145; Glassie 1978, 394-96; Kniffen and Glassie 1966, 59; Lay 1982, 18). These shared materialities created common sets of experiences that could have fostered new identities. Second, the Methodist Revolution swept through the Valley in the late$18^{\text {th }}$ century (Semmel 1973). Thousands of Lutherans and Presbyterians converted, creating shared religious identities (Longenecker 2002, 59-78; Mitchell 1977, 105). Third, the increased commercialization of Valley flour and the influx of mass-produced goods into the region eroded earlier religious identities, which had eschewed "worldly" goods and emphasized notions of plain living (Fennell 2017; Chappell 1986; Hofstra 2004, 321-25; Longenecker 2002, 79-111; 2000; McCleary 2010; Mitchell 1977, 106-7; Wust 1969, 186-99).

## Slavery and the Historiography of the Shenandoah Valley

This valley is populated by Germans and Quakers. They keep slaves... (Niemcewicz 1965, 90)

Enslaved people are noticeably absent from the preceding history. While this may seem like an unusual choice on my part, as Assembling Enslaved Lives focuses on these women, children, and men, slavery is either absent from or marginalized in $93 \%$ of the secondary sources I cited. ${ }^{3}$ Therefore, this conventional history raises two questions about the production of history

[^2]in the Shenandoah Valley; how were enslaved people removed from these narratives, and how does this affect our understanding of Valley history?

To answer these, we must critically deconstruct this historiography and explore the strategies generations of Valley historians used to place enslaved Shenandoahans outside the times and places they wrote about. Here, I draw on Michel-Rolph Trouillot's (1995) discussions of the power dynamics inherent in the creation of histories. Central to his work is the concept of traces, the material trails left behind by bodies as they move through time and space. While these may be literal trails, like wagon ruts gouged into historic roadbeds, traces may also be "buildings, dead bodies, censuses, monuments, [or] diaries" (Trouillot 1995, 29). While "history begins" with these materialities, they are not static entities, nor do they produce unambiguous evidence of past lives (Trouillot 1995, 29-30). Instead, authors choose which visible traces to mention and which to leave out, since a single study can never follow every possible trace (Trouillot 1995, 48). Even if this could be done, the result would be a jumbled series of data that could not be arranged into anything meaningful, since doing so would necessitate leaving something out to create a coherent narrative. We must focus on these choices and the strategies used to implement them when studying how histories are produced (Trouillot 1995, 49-52).

Often, these choices are influenced by and reproduce present-day racial, political, and economic orderings (Trouillot 1995, 148-51). This is where Wynter's demonic grounds come in, as contemporary anti-blackness led historians to silence the traces left by enslaved Shenandoahans, removing these people from the times and places that make up Valley history and reproducing white supremacist notions that Valley history is white history. This is not to say that all traces left by enslaved people have been silenced, as the discussion of agro-capitalism and locally-made ceramics presented above are full of the traces left by enslaved Shenandoahans
(see Chapters 5 and 9). Instead, these traces get reassigned to white Shenandoahans, further banishing enslaved people to the demonic grounds of Valley history. To address this, we need to switch from looking at what Valley histories say about the region and start looking at how they create versions of the Valley where Black lives are not allowed to matter.

## Placing Slavery in the Demonic Grounds

Samuel Kercheval published the first history of the Shenandoah Valley in 1833. ${ }^{4}$ As he was a member of a prominent local family, it comes as no surprise that Kercheval repeatedly mentions the "glorious" deeds of German and Scotch-Irish colonists, with special attention paid to conflicts with Native Americans. This creates an idealized version of the Valley, inhabited by heroic, hard-working white men (and occasionally their wives). Archival records show that some of these men were enslavers (Simmons 1997), and yet, Kercheval goes to great lengths to avoid mentioning this, or the women, children, and men they enslaved. This placed enslaved Shenandoahans in the demonic grounds of Valley history and created the misconception that white history and Valley history are one in the same. However, Kercheval does not rigorously maintain the boundaries of his demonic grounds, and Black Shenandoahans occasionally wander into his narrative as faceless, nameless enslaved people (1850, 43, 141-42, 314-15, 323), freedom seekers (1850, 66), or victims of Native raids (1850, 161, 174, 204). This often occurs when discussing Indigenous Americans, almost as if the presence of Native people dismantles

[^3]Kercheval's demonic grounds, allowing enslaved people to enter the text and sow doubts about whether his work actually portrays what life was like in the 18 th century. ${ }^{5}$

Kercheval's failure to maintain the boundaries of his demonic grounds highlights the fact that these places require more than removing people from historical narratives. They require strategies that let authors explain away rogue traces of enslaved life in ways that do not expose the fact that Black women and men are being systematically removed from these histories. Valley historians would later develop and refine these strategies, focusing on the argument that while some Shenandoahans may have enslaved Black Americans, most did not because slavery was incompatible with the Valley's ethnic, religious, and/or economic makeup. In other words, these scholars take instances where enslaved people made it into historical narratives and use them to argue that the very existence of enslaved Shenandoahans is at odds with the region's historical character, thereby further regulating enslaved people to the demonic grounds.

The earliest strategies, created around the turn of the $20^{\text {th }}$ century, involved scholars citing the Valley's religious and ethnic makeup as the reason why white Shenandoahans did not participate in the institution of slavery. Most white Shenandoahans belonged to "outsider religions" (sensu Longenecker 2002) - namely Lutheranism, Quakerism, Presbyterianism, and various Anabaptist sects - that were not as widespread in other parts of the South. Using this, historians claimed that slavery did not spread throughout the Valley because it was at odds with local religious teachings (e.g., T. K. Cartmell 1909, 215, 521; Waddell 1902, 414-15; Wayland 1912, 133, 266, 250, 275). These scholars further argued that ethnicity played a role in the

[^4]supposed lack of slavery in the region, arguing that "[ $t$ ]he Scotch-Irish race had no love for" the institution while Germans opposed it "[a]s a general rule" because of the religious "persecution and oppression" they endured in Europe - experiences which "left a smoldering fire within them that blazed up anew" when encountering American slavery (Waddell 1902, 414-15; Wayland 1907, 179-87). These strategies for erasing Black history emerged as white Shenandoahans were creating a new commemorative landscape by erecting monuments to Confederate soldiers and white colonizers (Denkler 2008; 2010), with statues and history books working together to advance white supremacy.

While scholars repeated ethnic/religious-based claims for the lack of slavery in the region into the 1950s (e.g., Couper 1952; Gordon 1930; Kellar 1928; Morton 1920; U. B. Phillips 1929; Strickler 1924; Wayland 1927), by the mid-20 ${ }^{\text {th }}$ century new generations of Valley historians began doubting these claims (e.g., Wust 1969, 121). However, by then the underlying argument that enslaved Shenandoahans did not belong in Valley histories had become hegemonic, leading scholars to look for new explanations for the purported lack of slavery instead of asking if the relative lack of slavery was a historical reality. The most common explanation they came up with was that local agricultural practices made slavery unnecessary, as the Valley's wheat farms required less labor than the tobacco plantations in eastern Virginia (e.g., Couper 1952; Julia Davis 1945; Hart 1942; Schlebecker 1971; Wust 1969). Scholars studying other wheat-producing regions of the South have made this same argument (e.g., Fields 1985; Fogel 1985; Fogel and Engerman 1974; J. D. Rice 1995).

Up until this point, the removal of enslaved people from local histories was not a trend unique to the Shenandoah Valley (e.g., Herskovits 1941). It was not until the rise of African diaspora archaeology and the new social history in the 1970s that white scholars began talking
about the lives and contributions of Black Southerners (e.g., Ascher and Fairbanks 1971; Blassingame 1972; Genovese 1976; Gutman 1976; Orser 1984). What is unusual, however, is the fact that most Valley histories written since the 1970s have either continued to argue that agricultural practices in the region made slavery largely unnecessary (e.g., Comstock 1994a; Fennell 2017; Hofstra 2004; Mitchell 1977, 131) or have ignored slavery altogether (e.g., BoydBragg 2005; Hofstra 1990; 2010; 2012; Hofstra and Mitchell 1993; Frantz 2001; Mahon 1999; Suter 1999; Tillson 1991). Ann Denkler $(2010,35)$ notes that these works often argue that the relatively "small" number of enslaved Shenandoahans makes studying them unnecessary. Yet, as she argues, these authors arbitrarily define the size of the region's enslaved population as being too small to study, often without pointing to extensive data from $19^{\text {th }}$-century census records to define what the author considers to be a "small" population, while simultaneously discussing at length the wealthiest families in the Valley, who comprised a smaller portion of the region's population than enslaved people. This logical slippage highlights the continued placement of enslaved Shenandoahans in the demonic grounds of local history, as these authors appear to be incapable of imagining a situation where enslaved lives could begin to matter in the Valley.

Studying the wealthiest families in the region is not a trend unique to late $20^{\text {th }}$-century historians, as local elites play prominent roles in most local histories. Many of these families enslaved people and those who write about them have developed strategies to minimize and contain this fact to prevent it from dismantling the demonic grounds their work reproduces. Some claim that white Shenandoahans found slavery "thrust upon them largely by the force of circumstances, and endured it unwillingly" (Wayland 1907, 179-80, my emphasis). Others romanticized the relationships between enslaved people and their enslavers (T. K. Cartmell 1909,

111, 202, 520-22). J.E. Norris (1890, 276), for instance, claims that an advertisement for the sale of an enslaved woman in 1833 bore:
a stamp of humanity about it that gives the lie to the wholesale charge of heartlessness on the part of those who owned slaves. Those who have never lived among the 'institution' as it existed in the [Antebellum] days cannot realize the verity of it.

This "stamp of humanity" was simply the fact that the woman's enslaver specified that she would not be sold into the interstate slave trade (also see Norris 1890, 485). These discursive strategies redirect attention from enslaved people and towards their enslavers, thereby maintaining the demonic grounds of Valley history.

Late $20^{\text {th }}$-century works take a different approach. Within the Valley, Clarke County contained the highest amount of enslaved people, many of whom were enslaved by absentee planters of English descent. Using this, scholars claimed that Clarke county was inherently different from the rest of the Valley and that this difference led slavery to thrive there and not in the rest of the region (e.g., Bliss 1951; Hofstra 1999; Mitchell 1977). However, census records show otherwise. In 1840 (four years after the formation of Clarke County), enslaved people accounted for over $20 \%$ of the population in four other Valley counties (Augusta, Jefferson, Rockbridge, and Warren), and $26.34 \%$ of households in Frederick County enslaved people (US Bureau of the Census 1840a; 1840c; 1840d; 1840e; 1840g). Despite arguments that larger plantations were common in Clarke, $85.12 \%$ of enslavers in Clarke County enslaved less than 20 people (US Bureau of the Census 1840b). Furthermore, counties and municipalities throughout the region also passed and enforced laws that supported slavery. Slavery was more pronounced in Clarke, but it was deeply entrenched throughout the Valley. This discursive amputation of Clarke County from the rest of the Valley prevents traces of slavery in the one place where they are most likely to come to the forefront from dismantling demonic grounds in the rest of the
region, and, yet again, transforms the presence of slavery into a discussion of the ways slavery was supposedly incompatible with the region's character.

Enslaved people are not the only group that has been systematically removed from Valley histories. Scholars routinely left out Women, Irish immigrants, landless laborers, and Free Black individuals. But these other groups were simply ignored, left unmentioned until the late- $20^{\text {th }}$ century. As the preceding pages show, enslaved people were not simply left out. Historians made up reasons why slavery and enslaved people could not have existed in any meaningful way. This tactic was never used to erase the possibility that these other groups lived in the Valley. We see no discussion of women being antithetical to wheat agriculture, or Scotch-Irish being opposed to the presence of Irish immigrants. These are ridiculous examples, but they are no different than the arguments presented above. This means that telling the stories of Irish immigrants in the Valley or women from poor and middling families is simply a matter of adding new stories to the Valley while telling the stories of enslaved Shenandoahans requires overturning decades of scholarship that confined enslaved people to the demonic grounds of Valley history.

## Removing Slavery from the Demonic Grounds

Scholars did not begin studying slavery in the Shenandoah Valley and dismantling the carefully constructed demonic grounds discussed above until the 1990s (C. C. Ballard 1998; Brundage 1990; C. B. Dew 1994; Simmons 1994; 1997). To introduce these works, I begin by summarizing what they have added to our understanding of Valley history and the ways they have shown that the strategies used to place slavery in the demonic grounds of local history do not reflect historical realities. Following this, I discuss the shortcomings of these works, especially how they homogenize the institution of slavery and inadvertently continue to obscure and silence the histories of enslaved Shenandoahans.

White colonists brought enslaved people into the Shenandoah Valley in the 1730s. While the number of enslaved Shenandoahans was relatively small at first, with only 760 enslaved people in the Valley by 1755 (Mitchell 1977, 96), local courts actively reinforced the institution (Simmons 1997), laying the groundwork for slavery to flourish in the region. The second half of the $18^{\text {th }}$ century saw slavery spread throughout the Valley, with enslaved people accounting for $9 \%$ of the population by 1790 (Mitchell 1977, 99) and $14 \%$ by 1800 (see Figure 2). White Shenandoahans chose to become enslavers for a variety of reasons (McCleskey 2014, 125; Simmons 1994, 17-18). While Scotch-Irish were more likely to enslave people than Germans, families that could afford to become enslavers generally did so regardless of their ethnic background (McCleskey 2014, 129; Simmons 1997, 164). As we see throughout the Americas, Valley enslavers considered Black women, children, and men to be a source of inter-generational wealth, and they use the legal system to ensure that the people they enslaved would be inherited by their children (Brophy and Thie 2016; McCleskey 2014). By 1810, 31\% of all households in Frederick County enslaved at least one person (US Bureau of the Census 1810a) (Appendix A, Table 4). While early enslavers predominantly purchased newly arrived Africans, many bought people from eastern planters, a trend that increased over time, eventually accounting for the vast majority of enslaved people brought into the region (McCleskey 2014, 130-31). Valley merchants often facilitated this by working as slave traders (McCleskey 2014, 127, 132). Fueled by the region's growing prosperity, the number of enslaved people in the Valley doubled from 1800 to 1840 (see Figure 2), while the economic downturn of the mid $-19^{\text {th }}$ century resulted in a decrease in the region's enslaved population as many enslavers emigrated, forcing enslaved Shenandoahans to accompany them, while others sold people into the interstate slave trade (Koons 2000a, 232; also see Denkler 2008; 2010; 2020).

The majority of enslavers in the Valley enslaved relatively few people (Koons 2000a; Simmons and Sorrells 2000), a trend we can see with census data from Fredrick and Clarke Counties (US Bureau of the Census 1830a; 1840b; 1840c; 1850c; 1850d; 1860b; 1860c) (Appendix A, Tables 5-12). Between 1830 and 1860, just over half of enslavers in Frederick County enslaved less than four people. ${ }^{6}$ Most Clarke County enslavers enslaved less than seven enslaved people in 1840 and 1850, and fewer than five people in 1860. Yet, as Kenneth Koons (2000a) notes, these figures give the false impression that enslaved Shenandoahans were largely isolated from one another. In 1830 and 1840, just under half of all people enslaved in Frederick County were enslaved by households that enslaved at least eight people, and approximately a quarter were enslaved by households that enslaved at least 14 people. By 1850 and 1860, this increased to just under half of all enslaved people being enslaved by households that enslaved at least 10 people and approximately a quarter were enslaved by households that enslaved at least 15 people.

Given the relatively small number of people most white Shenandoahans enslaved, enslavers often worked alongside Black women and men in the fields (McCleskey 2014; Koons 2000a; Simmons 1994; Simmons and Sorrells 2000). While this intimacy led earlier scholars to argue that Valley slavery was benign (e.g., Strickler 1924; Wayland 1927), first-person accounts of slavery in the region show that enslavers routinely used violence to terrorize and discipline enslaved people (e.g., B. Dew 1856, 45-52; Page News \& Courier 1932; Perdue et al. 1976, 243; Robinson 1972; Sims 1972; Still 1872a; 1872b; Veney 1889). Most studies of slavery acknowledge this violence and the effects it had on enslaved Shenandoahans. ${ }^{7}$

[^5]While one strategy for silencing slavery in the Valley argued that wheat's labor requirements made slavery unnecessary, the mixed farming that dominated Valley agriculture required substantially more labor than previously acknowledged. Using diaries kept by local farmers, Kenneth Keller (Keller 2000, 27) demonstrates that enslaved Shenandoahans worked long, hard days throughout the year (also see Chapter 5). Gavin Wright (2003) further discusses the emergence of wheat cultivation in eastern Virginia, where the adoption of this cash crop did not result in large-scale changes in the number of people eastern planters enslaved (also see Berlin 1998; Clemens 1980; Gill 1978; Neiman 2008). As slavery became more common in the Valley, enslavers developed a widespread system of hiring, where local farmers rented out enslaved people, often for one year (C. C. Ballard 1998; Koons 2000a; Simmons 1994; Simmons and Sorrells 2000), a practice used in other wheat-producing parts of the South (e.g., Pargas 2010; Schermerhorn 2011; Zaborney 2012).

By the 1840s most white Shenandoahans supported slavery to varying degrees and even those who proclaimed that the institution would "undermine and destroy everything like virtue and morality" favored a gradual emancipation that would leave the institution largely intact for years, suggesting that even they could not fully envision a world without enslaved people (Longenecker 2002, 121-24). Simmons and Sorrel (2000) argue that hiring served as an important mechanism through which slavery became hegemonic in the Valley, as it transformed a large number of white Shenandoahans into temporary enslavers. Changes in religious practices also contributed to this transformation. The Valley's largest $18^{\text {th }}$-century denominations Lutheranism and Presbyterianism - both supported the institution, although Presbyterians were more likely to become enslavers (Longenecker 2002, 127-28). In the late-18 ${ }^{\text {th }}$ century, Baptists began suppressing earlier anti-slavery sentiments and by the early- $19^{\text {th }}$ century, many Valley

Baptists had become enslavers (Longenecker 2002, 129). Similarly, early-19 ${ }^{\text {th }}$-century Methodists opposed slavery, but as the Methodist Revolution swept through the Valley many enslavers converted, resulting in a gradual dismantling of the sect's anti-slavery views. By the mid $-19^{\text {th }}$ century, most Methodist congregations supported slavery (Longenecker 2000; 2002, 142-50). By 1850, this left four smaller groups - Dunkers, Mennonites, Quakers, and Reformed - as the Valley's sole anti-slavery voices. Yet even these could not fully separate themselves from the growing influence of slavery in the region, as members of these denominations enslaved people (Longenecker 2002, 137-42). Scholars have also written extensively about slavery during the Civil War (Ayers 2017; Noyalas 2021; Koons 2018; Berkey 2003a; 2003b), providing important insights into what life was like for enslavers and enslaved alike while the institution of slavery was being violently dismantled in the Valley.

By studying and writing about slavery in the Shenandoah Valley, this new wave of scholarship has begun dismantling the demonic grounds previous historians have created. Yet, the mere fact that they perform this invaluable work does not mean that we should not critique these narratives. While they disrupt the argument that slavery is superfluous to our understanding of the Valley by demonstrating its connection with and contributions to local political economies, a closer look at how they do this reveals an unsettling trend. Despite this new focus on slavery, enslaved people themselves remain largely hidden, and their stories are left untold.

Here we need to distinguish between studying slavery as a homogenized institution and studying the various people, practices, and discourses through which this institution, and the lives of those enslaved by it, came into being. Taking a homogenized approach collapses the people, things, and discourses that comprised slavery in the Shenandoah Valley - such as enslaved people and their labor, enslavers and the technologies of terror and control they
implemented, and the political economies that allowed slavery and local agriculture to flourish into a single analytical category. In other words, this blackboxes slavery (sensu Latour 1999), silencing its inner components to create a more uniform narrative. Blackboxing slavery may make sense for some types of analysis (Fowler 2013, 52), especially when talking about slavery writ large, and how it interacted with other institutions in the Valley. What this blackboxing is not good for, however, is addressing how slavery operated and the ways it shaped the lives of enslaved Shenandoahans across generations. Furthermore, because enslaved people are part of these blackboxes, histories of Valley slavery do not present enslaved people as historical actors in their own right - a role that only white Shenandoahans play in these narratives. The alternative approach to homogenizing and blackboxing slavery is to open up this analytical category and study the various people, materialities, economies, discourses, and institutions through which it operated. Doing so allows us to study the lives of those enslaved in the Shenandoah Valley, to ask what their lives were like and how they contributed to the region's political economies.

This is not to suggest that enslaved lives are completely absent from discussions of Valley slavery. Scholars mention the labor performed by enslaved people (Keller 2000, 27; Koons 2000a), the participation of enslaved Shenandoahans in local economies (Simmons and Sorrells 2000, 177-78), the families they created (Katherine L. Brown 2009, 27-43; Denkler 2020; Longenecker 2002, 124; Simmons 1994, 58-60), the congregations they worshiped in (Longenecker 2002, 130-35; Simmons 1994, 52-55), and even enslaved people striking back at their oppressors (Denkler 2020; D. A. Lee and Hofstra 1999). However, these are only used as details to round out larger stories of slavery and never treated as subjects of inquiry in-and-of themselves. The one exception to this is Jonathon Noyalas's (2021) study of Black Shenandoahans during and immediately after the Civil War, which places its full emphasis on

Black women, children, and men. However, we still lack a detailed study of enslaved life in the Shenandoah Valley before $1861 .{ }^{8}$

The existing literature's inattention to enslaved life is partly the result of the sources they draw on, usually consisting of census records, legal statutes, and personal documents written by enslavers - an incredibly useful archive, albeit one with some severe limitations (see Hartman 2008). Often scholars supplement these with narratives of people formerly enslaved in the region, especially the story of Bethany Veney (1889), which contains detailed information on a narrow range of topics. While previously unused documents like merchants' ledgers can add new dimensions to our understanding of enslaved life, archaeology provides a body of evidence that can be used alongside written documents. Using written and archaeological sources, Assembling Enslaved Lives sets out to provide the first in-depth history of some of the enslaved people in the Shenandoah Valley before 1861. But just having this data is not enough, as enslaved life has been left out of previous works because the questions scholars asked, and the ways they answer them, have not focused on the lived experiences of enslaved Shenandoahans (also see McKittrick 2013; 2014). Avoiding this requires new ways of theorizing enslaved life in the region, and these are the topics of Chapters 2 and 3.

[^6]
## Chapter 2: Thinking with Assemblages

All that you touch you change. All that you change changes you.
(O. E. Butler 2000, 3)

In this chapter, I introduce assemblage thinking and use it to craft a theoretical and methodological framework that focuses on the effects that radiated outward from enslaved people's interactions with the things, plants, animals, places, institutions, discourses, and nonenslaved people that made up the Shenandoah Valley's political economies. While I use examples from enslaved life in the Shenandoah Valley to illustrate this way of thinking and the methods I derive from it, I provide a more extensive treatment of slavery in the following chapter, which explicitly combines assemblage thinking with critical insights from Black studies.

I would like to start by posing a rhetorical question - why is this study necessary? Why spend time and money researching the lives of those enslaved in the Shenandoah Valley when we could use existing literature on enslaved people in other parts of the South to describe their lives? While we can answer this in several ways, they all hinge on the assertion that the Valley is different from other parts of the South, and even from other parts of Virginia. Here, large numbers of German and Scotch-Irish descended people interacted with specific sets of materialities, practices, and institutions to create Valley-specific political economies. To explore what life was like for those enslaved in the Valley, we must attend to the people and things that made it unique because these shaped the lives of enslaved Shenandoahans. Because each of these affected enslaved people, we need a theoretical framework that highlights how parts (ceramics, racializing notions, etc.) come together to form wholes (enslaved life, political economies, etc.). Furthermore, to theorize how enslaved Shenandoahans affected the worlds around them, we need
to be able to think about how parts are affected by the fleeting, porous, and perpetually shifting wholes they help create.

Contextual archaeology (e.g., Hodder and Hutson 2003; Johnsen and Olsen 1992; Shackel and Little 1992), and fragmentation studies (Chapman 2000; Chapman and Gaydarska 2007) address how parts create wholes. However, these overemphasize wholes, obscuring the physical capabilities of, relationships between, and alterations to their constituent parts (Hamilakis and Jones 2017, 83; O. J. T. Harris and Cipolla 2017, 146-47; Henare et al. 2007, 3; A. M. Jones 2004, 328; A. M. Jones and Alberti 2013, 27-30). Connecting this to last chapter's discussion of slavery, contextual archaeology and fragmentation studies would let us see how enslaved people, local elites, merchants, wheat, ceramics, and local laws contributed to the Valley's political economies. However, doing so would put our emphasis on these political economies and not on the people, things, and discourses that composed them. In other words, we would blackbox (sensu Latour 1999) slavery, making it hard to see how the individual components of Valley political economies interacted in ways that fundamentally changed these people, things, and discourses. Addressing these is important because, again, blackboxing slavery can lead us to focus more on slavery as a homogenized institution than on enslaved women, children, and men. To use another example, Patricia Samford (2007) uses contextual archaeology to study the role subfloor pits (small cellars used to store food and/or personal items) played in the creation of creolized Black Virginian cultures. But her focus on creolization leaves us with relatively little information about how these new cultural understandings affected the ways enslaved Virginians interacted with the world around them.

So instead, I turn to a third theoretical tradition - assemblage thinking. This also focuses on how parts work together to create wholes. But it provides a more open framework, one that
lets us tack between the emergent effects that come about when people, plants, animals, and things come together and interact and the ways that these effects come to shape the parts that created them. In other words, it is not just about what goes into making a whole, but about understanding the process of fitting together that occurs when things come together and tracing out the various way these processes shape the things that create them and the broader worlds they are entangled in. This lets us see how enslaved people both affected and were affected by the Valley's political economies. Returning to Samford's research, an assemblage-based approach to creolization would focus on how new creolized world views changed how enslaved people interacted with the people, things, and discourses around them. What this ultimately gives us is a more expansive view of how people affect and in turn come to be affected by the sociomaterial worlds around them than other theoretical frameworks can offer.

## Assemblage Thinking

As an assemblage, a book has only itself, in connection with other assemblages and in relation to other bodies.... We will never ask what a book means, as signified or signified; we will not look for anything to understand in it. We will only ask what it functions with.... (Deleuze and Guattari 1987, 4)

Assemblage thinking is a broad body of literature within the new materialism (in)directly influenced by the work of Giles Deleuze and Felix Guattari (e.g., Deleuze 1994; Deleuze and Guattari $1977 ; 1987 ; 1994) .{ }^{9}$ The initial wave of new materialism-inspired archaeologies (e.g., Alberti and Marshall 2009; Gosden 2005; Hodder 2012; Malafouris and Knappett 2008; Olsen 2003; 2010; Witmore 2007; Knappett 2011) did not engage with assemblage thinking (but see Conneller 2004; Sofaer 2006). However, archaeologists have increasingly adopted assemblage-

[^7]based frameworks in the past decade (Hamilakis and Jones 2017) to explore archaeological practice (e.g., H. Cobb and Croucher 2014; R. Harrison 2011; Lucas 2012), households and communities (e.g., Gilmore 2016; O. J. T. Harris 2014; Marsh 2016; Maxwell and Oliver 2017), burials and bodies (e.g., Crellin 2017; Fowler 2013; Hamilakis 2013; Novak and Warner-Smith 2020a), identities and personhood (e.g., Conneller 2004; Jervis 2017; Law Pezzarossi 2014), and, colonialism, power, and capitalism (e.g., Cipolla 2018; Cipolla and Allard 2019; Corcoran-Tadd and Pezzarossi 2018; Duke 2019; Khatchadourian 2016; Pezzarossi 2015a; 2015b; 2019; Pezzarossi and Kennedy 2019; A. T. Smith 2015).

Some argue that assemblage thinking must strictly adhere to the work of Deleuze and Guattari (e.g., I. Buchanan 2015; 2017), while others propose reinterpreting and reinventing their work (e.g., Colombat 1991; Fowler 2013; Weheliye 2014, 47). I take the latter approach, with my understanding of assemblages owing as much to Antonio Benítez-Rojo (1996), Manuel DeLanda (1997; 2011; 2016), Édouard Glissant (1989; 1997), Elizabeth Grosz (2008), Yannis Hamilakis (2013; 2017; Hamilakis and Jones 2017), Jasbir Puar (2007; 2012; 2017), Anna Tsing (2005; 2015), Adam Smith (2015), and Alexander Weheliye (2014) and allied scholars Sara Ahmed (2007), Judith Butler (1993), and Michel Foucault (1980; 1990; 1995) as to Deleuze and Guattari. This creates an at-times idiosyncratic view of assemblages based on my reinterpretation of others' ideas, and I explain any major alterations I make to these views in the footnotes instead of the main text to make this chapter more readable.

Assemblage thinking argues that essences, internal qualities that "uniquely and necessarily define" things, do not exist (Nail 2017, 23). Instead, everything - people, plants, animals, practices, discourses, institutions, and ceramic sherds - exist as intricately entangled
assemblages. ${ }^{10}$ Here, "assemblage" does not refer to a collection of artifacts (Hamilakis and Jones 2017; Joyce 2010; A. T. Smith 2015, 43-47). Instead, "assemblages" in assemblage thinking refers to both a process, an "action of matching and fitting together a set of [heterogeneous] components" that come to function together as a contingent whole (DeLanda 2016, 1), and the wholes (e.g., people, institutions, economies) that are composed from interactions between these parts (Nail 2017, 22). Assemblages are not just the sum of their parts, but the sum of their parts plus the sum of the contingent and ever-shifting effects created when their parts interact.

Admittedly, the English word "assemblage" does not quite express the active nature of these groupings. In their original work, written in French, Deleuze and Guattari used the term agencement, which refers to both a process and a product (J. Phillips 2006, 108). The first English translations (Deleuze and Guattari 1981) used "assemblage" to refer to Deleuze and Guattari's concept of "agencement," and most Anglophone scholars, especially archeologists, continue to use "assemblage." Some English-language texts (e.g., Gherardi 2016) try to avoid confusion by using "agencement," but I use "assemblage" in keeping with the existing archaeological literature. That being said, I also find it helpful to think about and refer to assemblages as the act of composing and as the compositions created by these acts, both because of the musical connotations of composing (the act of arranging elements together to produce a song that is made to be more than the sum of its notes by the way they play off one another) and

[^8]the destructive connotations of decomposition (where compositions fall apart as their elements no longer function together in the same way). ${ }^{11}$

Heterogeneity plays an important role in assemblage thinking, undermining the theoretical underpinnings of essentialism which require homogeneity to create and maintain essences. ${ }^{12}$ Even when we look at seemingly homogenous assemblages, say the 1760 s military garrison at Fort Loudon (see Chapter 1), we see class divisions and people with different life histories, sexualities, habits, etc. This garrison was also composed of multiple species, as without Valley beef and wheat it could not survive, and the political economies that brought food to the garrison played a critical role in maintaining it. Rather than being problematic, these differences allowed the garrison to operate (e.g., Braidotti 1994). Without rank and class divisions, for instance, military officers could not give orders. This heterogeneity is also temporal. Assemblages do not stay the same throughout time. Instead, they change as old parts leave, new parts enter, and/or relationships between parts change, forcing the composition to become something new. This makes assemblages perpetually open-ended and "defined" by their "capacity to undergo permutations and transformations" (Grosz 1993, 170).

Every part of these contingent compositions matters, for without each of them these wholes would emerge differently (Bennett 2010). Once brought together, these parts act upon one another, creating a series of cascading effects that form these emergent wholes (e.g.,

[^9]DeLanda 2016; Tsing 2015). This is not to say that every part has the same impact on the overall composition, but simply that each helps to create effects that would not be possible without them (W. Harris 1990, 179; Murray-Román 2015). At the same time, these effects transform the parts that created them. ${ }^{13}$ To be part of an assemblage is to have the ability to affect other components while being affected by them (e.g., Deleuze 1988, 71). This aspect of assemblage thinking is in line with Michel Foucault's (e.g., 1990; 1995) views on power, which he argued is distributed throughout collectives, letting each and every part affect how political relations operate (also see Deleuze 1988; Deleuze and Guattari 1987, 530-31).

Assemblages operate at multiple scales, from the subatomic to the galactic. Their components can simultaneously belong to an infinite number of assemblages while themselves being composed of other assemblages (O. J. T. Harris 2017). Considering these scales, assemblage thinking adheres to a flat ontology or the understanding that there is no a priori hierarchy amongst these groupings, which suggests that we may approach assemblages that operate at different scales using the same sets of concepts (DeLanda 2002; O. J. T. Harris 2017, 129-30; Jervis 2014, 24). In other words, we can see biological cells and global capitalism as assemblages, as entities created by the action of fitting together heterogeneous components that function together, and which become entangled in a series of other assemblages. This also points to a key difference between assemblage thinking and more hieratical approaches like systems theory (which influenced Deleuze and Guattari's theorizations), because determining how an overall "system" (or assemblage) works and operationalizing this knowledge is not more important than understanding the parts that come together to form that system and how being

[^10]part of this system affects them. In other words, studying the parts of a system for their own sake is equally important as studying the system as a whole. This critique generally applies to contextual archaeology and fragmentation studies as well (see above). Assemblage thinking's ontological sameness, however, does not mean that cells and global capitalism are the same, as they are composed of different parts that interact in different ways and produce different effects (Tsing 2015, 37-39). But we can use assemblages to theorize both. Flat ontologies also do not imply that hierarchies cannot form within assemblages, but that such orderings are temporary and contingent, and that we must always question how and why hierarchies emerge instead of naturalizing their existence or downplaying their effects (Janae Davis et al. 2019, 7; DeLanda 1997; Deleuze and Guattari 1987; Saldanha 2012, 195). ${ }^{14}$

At this point, an example may help to reinforce our understanding of what an assemblage is. So let us look at Sally, a farmer enslaved at Belle Grove in the late- $18^{\text {th }}$ century (I. Hite 1785). As a person, she is an assemblage (albeit a different type of assemblage than a political institution or a ceramic sherd), composed of various corporeal (cells, tissues, substances, etc.) and noncorporeal elements (cultural understandings, habitual practices, emotions, etc.). Who

Sally was as a person emerged across her life course from the contingent ways these heterogeneous components interacted with one another (Berry 2017; Frost 2016). Her cells died

[^11]and were replaced. Her muscles and tendons were torn apart, and rebuilt, as she worked the plow. Perhaps an accident harvesting wheat left her with "a large scar on one of her arms near the hand, cut by a scythe" (Tallman 1793). Her understanding of the world and how she moved through it changed as she aged and as she encountered new phenomena (new varieties of wheat, new laws restricting her ability to buy or sell things, etc.) that required novel explanations and/or practices (Deleuze 1994). As a result, these new entities became part of the assemblage that formed Sally.

Similarly, assemblages that we may call social structures impacted Sally's composition. She was a part of the assemblage through which slavery operated. Being part of this assemblage affected Sally in numerous ways, making her more subjectable to sexual violence and certain types of bodily injury than white women. Plowing fields, sowing seeds, and threshing wheat brought her into agro-capitalist assemblages that generated profit (an emergent effect) by connecting flour milled from Valley wheat with hungry people throughout the Atlantic world. When Sally bought items from local merchants, she participated in other sets of capitalist assemblages, the contours of which she could impact (at least to some degree) by exchanging money and/or goods for commodities. Participating in these compositions also allowed Sally to change when she bought medications to alleviate aches and pains brought on by agricultural labor, or food to stem the hunger pangs brought on by inadequate rations.

Assemblages help us think about enslaved life in the Shenandoah Valley by theorizing how the lives of enslaved people (which we can see as assemblages) emerged in and through their interaction with the grain, hunger, ceramics, market towns, and architecture that made up the Valley's political economies (which we can also see as a series of assemblages). We can address how components of these Valley-specific political economies affected enslaved life in
the Shenandoah Valley, creating ways of living that were unique to the region. We can also dynamically address how enslaved people affected the Valley's political economies (its people, ceramic industry, agro-capitalism, biopolitical regimes, racializing notions, etc.) by interacting with its grain, market towns, ceramics, and landscapes. Because enslaved people were part of these political-economic assemblages, they contributed to them and these contributions must be acknowledged if we are to create a fuller account of the Valley's history. This provides a fundamentally different view of enslaved Shenandoahans pre-1861 than seen in previous histories, one which sees Black women and men as historical agents who shaped the region's political-economic development. Now that we have a basic understanding of assemblages, we can address its focus on effects and the ways certain assemblages repeat across time and space, both of which are critical for operationalizing assemblage thinking.

## Poetics of Friction

Opacities can coexist and converge, weaving fabrics. To understand these truly one must focus on the texture of the weave and not on the nature of its components. For the time being, perhaps, give up this old obsession with discovering what lies at the bottom of natures (Glissant 1997, 190)

Deleuze and Guattari (1987, 4, my emphasis) state that they are not interested in what an assemblage "means" and "will never look for anything to understand in it," for to do so would be to mine its depths in search of an essence. Instead, they (1987, 5, 257, my emphasis ) argue that "[w]e know nothing about [an assemblage] until we know what it can do" - how its parts interact to create emergent effects that transform the assemblage as a whole and the parts that compose it (also see M. H. Johnson 2013). ${ }^{15}$ This is not to argue that meaning cannot emerge from assemblages, as the creation of meaning may be one of the things that an assemblage does, but

[^12]we should focus on actions, doings, and effects (and potentially the meanings that emerge from them) instead of hermeneutically deciphering inherent meaning in things and actions we study that "uniquely and necessarily define" them (contra Hodder 1999; Johnsen and Olsen 1992).

Édouard Glissant (1997, 189-91) further argues that searching for meaning reduces an "irreducible singularity" down to a single factor (or set of factors). For example, we could look at James, an enslaved man who bought a set of teacups and saucers from a Jefferson County merchant on 4 January 1797 (Account Book 2 1797, 340). If we want to find an inherent meaning in this action, a singular motivating drive that lead James to buy these teacups, we could argue that he was attempting "to maintain or change the physical and social conditions of [his] existence" (Heath 2017, 3) by signaling his socioeconomic worth to other enslaved people (e.g., Galle 2010), performing various identities (e.g., Wilkie and Farnsworth 2005), or subverting the institution of slavery (e.g., Symanski 2012). Or, we might argue that this act meant all three things at once. Yet, because this action emerged from a heterogeneous mixture of needs, tastes, desires, global trade networks, the ceramics the merchant had available, the constraints of slavery, and James's ability to buy teawares, reducing this action down to a single factor, or even three factors, is problematic. To find inherent meaning in this assemblage we must find something that "uniquely and necessarily define[s]" James's action by emphasizing some components and downplaying others (Nail 2017, 23; also see Trouillot 1995).

Some might argue that making these kinds of choices and ascribing meaning to James's action is the only way we can tell his story. But Glissant (1997, 25, 32, 190) provides a different approach, one that avoids the temptation to reduce this action to a single factor by instead describing its poetics. ${ }^{16}$ Put differently, we should identify the components of James's action-

[^13]qua-assemblage, look at how these components interact, and address how these interactions created effects that changed this assemblage and its parts (also see Lincoln 2011, 6; R. R. Phillips 2002, 118). Again, meaning might be something that emerges from poetics, but studying meaning in this way positions meaning as contingent and ever-shifting instead of something inherent. It is important to note that Glissant's poetics have been criticized for an inattention to power and affect (Palmer 2017; Trouillot 2002), but this criticism is aimed more at the way scholars (including Glissant) use the concept than a flaw in this methodology (also see ChudeSokei 2018). In this way, poetics lets us identify components and effects that we might not have noticed otherwise (Tsing 2015, 17-25), and the meanings politics, and emotions that emerge from them. Exploring the poetics of James's act of consumption would mean asking how the various components (needs, desires, supply chains, etc.) that made up this assemblage played off one another to create a series of effects that impacted local economies, the institution of slavery, and James's ability to consume beverages and connect with the people around him.

While poetics provides a general approach for working with assemblages, connecting it with Anna Tsing's concept of friction focuses our efforts on "the awkward, unequal, unstable, and creative qualities of interconnection across difference" that occur within assemblages (Tsing 2005, 4; also see Glissant 1997, 138; T. L. King 2019; Macharia 2019; Tinsley 2008). ${ }^{17}$ Friction is required for movement to occur. ${ }^{18}$ The friction generated when a wheel "encounter[s]... the

[^14]surface of [a] road" allows it to move; without friction, the wheel goes nowhere (Tsing 2005, 5). Friction is also transformative, wearing down both the wheel and the road, affecting how they act in future assemblages. Despite the resistive connotations of friction, it makes and unmakes hegemonies and political economies (Tsing 2005, 6; also see Ingold and Hallam 2014). Capitalist and colonial assemblages operate by debilitating certain groups of people, slowly grinding down workers' bodies to allow for the maximum accumulation of profit or maiming colonized people to perpetuate white supremacy (Puar 2017). We see this in the Shenandoah Valley, where men who owned their own farms lived, on average, 16 years longer than white laborers and enslaved men (Buck 1996; 1997a; 1997b) (Appendix B, Tables 1-3). ${ }^{19}$ Without the grinding force of friction and the premature deaths they created, political-economic assemblages would not function, making violent effects a feature of capitalism and colonialism instead of an accidental byproduct. To explore how things grind against one another within assemblages and how these "heterogeneous and unequal encounters can lead to new arrangements of culture and power" is to engage in the poetics of friction (Tsing 2005, 5).

While Tsing uses friction as a metaphor, we can see it as a material process (also see Ingold and Hallam 2014; T. L. King 2019; Tinsley 2008). Friction between a spoon and the sides of a bowl allowed an enslaved woman to scrape food off the vessel's side while marring the surface of the utensil and the ceramic. Friction generated by the interaction between this woman and the scythe she used to reap wheat helped create agro-capitalist assemblages that generated profit for her enslavers and potentially debilitating injuries for herself. To engage in the poetics of friction, at least from an archaeological perspective, is to look for the impressions things left on each other (Ahmed 2004). To put this another way, our goal is to identify the traces left by

[^15]friction and craft historical narratives from them (Joyce 2006; 2012; 2015). Following Trouillot (1995, 29), such traces can be artifacts, but they may also be "buildings, dead bodies, censuses, monuments, diaries, [or] political boundaries." Returning to James purchasing the teawares, traces left by this assemblage may be seen in the ledger that recorded this event and in the broken sherds we might recover by excavating James's home. When James used the teawares they entered new assemblages and the friction of these encounters left wear patterns and residues that we can see with microscopes and spectrometers.

To paraphrase Tsing $(2005,18)$, "the [poetic] possibilities of friction" and the traces these actions left behind are "explored in... the chapters that follow." This provides two insights that help address my research questions. First, attending to the poetics of enslaved lives shifts our focus away from what slavery meant to Valley history or what being enslaved in the region meant to those held in bondage here. Instead, it provides a focus on what enslaved people did, on the frictions generated when they interacted with the political economies around them, and how these effects accumulated in ways that shaped the history of the Shenandoah Valley. Second, we can flip this focus around and explore the poetics of wheat, ceramics, or bricks, providing a way of theorizing how these things created effects that shaped enslaved life in the Valley. But, before we can engage with these poetics, we need a way to think about how their effects reverberated across time and space.

## Repeating Compositions

Within the (dis)order that swarms around what we already know of as Nature, it is possible to observe dynamic states or regularities that repeat themselves... (Benítez-Rojo 1996, 2)

Assemblages constantly change as parts enter, leave, and become altered through friction. Because of this, the worlds envisioned by assemblage thinkers are chaotic and constantly in flux
(e.g., Grosz 2008; contra Ingold 2015, 7). Yet, compositions can repeat within this chaos when the same parts interact in the same way to create similar effects across time and space (also see DeLanda 2011; 2016). We might call these traditions, institutions, or habits. Assemblages that "repeat" are not carbon copies of each other - with identical components coming together and interacting in identical ways. Even though a "tug... of sameness" may orient assemblages in ways that make them alike, there are always differences within repetition (Benítez-Rojo 1996, 3;

Deleuze 1994; Glissant 1989, 97). ${ }^{20}$ To explore the poetics of friction beyond the instant in which things come together and the effects that arise from these specific moments, we need a way to think about and describe how certain assemblages repeat.

To do this, I read the work of Manuel DeLanda (e.g., 2016, 3) through Antonio Benítez-
Rojo (1996) to argue that some assemblages repeat in ways that exert tighter control over their components, limiting the ability of new parts to enter into these compositions, for existing parts to wander away, or for internal realignments that lead components to interact in different ways.

One example of this would be assemblages that repeat in similar ways for centuries, like the force of gravity or the violent extraction of resources from (formerly) colonized places. We can see this as something akin to historical processes playing out through the repetition of assemblages over the longue durée (sensu Braudel 1982). Other assemblages have less control over their parts, making their effects less likely to repeat in the same ways. ${ }^{21}$ At the extreme end

[^16]of this spectrum would be an assemblage that occurred once and never repeats itself - something akin to a singular event. What we are describing with the concepts of tighter and looser assemblages is the degree to which these compositions create effects that increase or decrease the probability of their parts becoming assembled and producing similar effects in the future. Or, in other words, the likelihood of the assemblage becoming recomposed (repeating) or decomposed (not repeating). Because assemblages (like the institution of slavery) are composed of other assemblages, they can repeat even if some of their constituent assemblages are more prone to change (like enslaved people buying different types of ceramics over time).

Here it helps to bring in Sara Ahmed's (e.g., 2007, 152-53) discussion of orientation, or how assemblages "put some things and not others [with]in our reach," shaping the kinds of actions we can engage in. When assemblages repeat, their components become oriented towards each other in a variety of ways. Some are close while others are far. Some could be near but prevented from directly interacting because other components are in the way. In loosely repeating assemblages these orientations can easily change. But in taught assemblages, like notions of race that have persisted for the past 500 years, certain orientations get held in place and inherited by future iterations of these assemblages, even as some of their components shift over time, producing different experiences of racism and different ways to carve out a life for oneself within these assemblages. This makes racial classification a series of orientations "inherited through the very placement of things," with "whiteness" being "an orientation that [continually] puts certain things within reach" of specific groups of people and out of reach for others (Ahmed 2007, 154-55). Framing assemblages in this way provides the "strong sense of

[^17]ethical responsibility and accountability to the haunting memory, historical trauma, and the reality of death surrounding" that postcolonial and Black-studies scholars demand (e.g., BenítezRojo 1996; Glissant 1989; 1997; Puar 2007; 2017; Weheliye 2014; Yountae 2014, 287) and which strict adherence to Deleuze and Guattari's philosophy ignores (see Byrd 2011; T. L. King 2017; Tuck 2010). ${ }^{22}$

We can describe the tautness of assemblages in three ways (DeLanda 2016, 3; Lucas 2012, 196-202). ${ }^{23}$ The first is how territorialized these repetitions are, or the extent to which new components are prevented from entering and existing components are prevented from leaving.

The second is how coded these repetitions are, or the degree to which parts will continue to articulate and function together in similar ways in various iterations of these assemblages. For instance, a more tightly coded song would be one in which the musicians play the same beat and melody in the same key, whereas a loosely coded song might be polyrhythmic, with musicians coming together at various intervals but otherwise playing at different beats (also see BenítezRojo 1996; Tsing 2015, 23-24). Territorialization and coding primarily concern the components of assemblages and the way they interact. The third way of describing the tautness of assemblages, however, has to do with effects and the ways they cite (or call back to) (sensu J. Butler 1993) the effects produced by previous compositions, be they separated by an instance or a millennium. ${ }^{24}$ When we are talking about assemblages that repeat quickly, and whose

[^18]territorialization and coding allow them to generate similar effects, we can describe them as having a high degree of citationality, although to do so may seem redundant. However, when we consider assemblages that repeat less frequently or cases where similar effects emerge from different sets of components, being able to describe these similarities is helpful. ${ }^{25}$

To further illustrate these three ways of describing assemblages, let us consider the broken fragments of a locally made, lead-glazed crock recovered from Quarter Site B. This vessel likely arrived at the site after an enslaved woman acquired it from a local merchant (see Chapter 7), an act which reterritorialized these assemblages by removing the vessel from compositions directly associated with the merchant and bringing it into compositions more directly associated with the woman. As a result, if and when these assemblages repeat, they would do so in different ways due to the absence/presence of the vessel (Fowles 2010). After bringing the vessel home the woman may have used it to make and store pickled okra, with the crock's rigid, nonporous sides territorializing the pickled okra-qua-assemblage, keeping the components contained within the crock and preventing new components from entering. In the crock, the brine and the okra interacted with one another, becoming coded into a new food (i.e., pickled okra).

If one of the ingredients went bad while the okra was being stored (say the okra began to decompose) it would create a series of effects that might decode the ways these assemblages

[^19]repeat by introducing flavors (and potentially smells) that would not work with the others in the same ways. Furthermore, the lead glaze which afforded the crock its ability to territorialize this assemblage may itself become deterritorialized, allowing heavy metals to seep into the pickled okra, giving this dish the ability to decompose the bodily assemblages it came into contact with (i.e. anyone who ate the okra). Finally, if this woman used the same vessel and the same sets of ingredients to make pickled okra in the future, the effects of these assemblages (i.e., the pickled okra that resulted from them and the introduction of lead into this food) would cite each other. However, if she used a different vessel, say a salt-glazed stoneware crock, while using the same recipe, these assemblages would still cite one another if they produced similar pickled okras, but not in terms of the addition of the lead, which would not be present in the okra pickled in the salt-glazed vessel.

When we talk about the repetition of assemblages, however, we are not always having relatively lighthearted discussions about pickled okra. Assemblages also describe power relations. Here, it is helpful to turn briefly to Foucault and his concept of the apparatus. To Foucault (1980, 194-95, my emphasis), an apparatus is "a system of relations... that can exist between...a thoroughly heterogeneous ensemble consisting of" discourses, institutions, and materialities that reproduce specific sets of power dynamics. Or as Giorgio Agamben (2009, 14) puts it, apparatuses are "literally anything that has in some way the capacity to capture, orient, determine, intercept, model, control, or secure" (i.e., has the power to affect) other entities to generate political effects. ${ }^{26}$ Importantly, apparatuses are not stable objects that "preexists [their]

[^20]own functioning," but rather emerge "through the manner in which [their] elements... work together" to (re)create people and things in ways that are useful in the perpetuation of these ensembles (West-Pavlov 2009, 150; also see Agamben 2009, 11).

If we read this through assemblage thinking we can see Foucauldian apparatuses as assemblages (Deleuze 1992; Deleuze and Guattari 1987, 352; Legg 2011) - as groups of heterogenous elements who become ordered in politically useful ways that increase the likelihood of these orders, and the political effects they produce, repeating in future assemblages. Or, perhaps more aptly, we can see an apparatus as a specific type of assemblage, one whose tautness works to recite particular political effects by maintaining certain relationships between its parts as they move across time and space (contra Legg 2011). However, this process can never be complete. Parts will always enter and leave, things will always shift, and " $[t]$ he more [an apparatus] works in favor of an oppressive order, the more it calls forth disorder" (Glissant 1997, 138). While some of these escape routes and slippages provide ways for parts to break free from the oppressive hold of apparatuses, others provide the impetus for apparatuses to find new ways to stop leakages. In this, we see an important qualification placed upon more traditional Foucauldian apparatuses. While Foucault (e.g., 1990, 96) argued for the importance of resistance in recomposing apparatuses, assemblage thinking further argues that some apparatuses can be decomposed (Deleuze and Guattari 1987, 531), while others may allow alternative modes of life to exist within or alongside them (Weheliye 2014). ${ }^{27}$

[^21]Recognizing this potential is critical for exploring how enslaved people affected the Shenandoah Valley's political economies. While enslaved people were profoundly affected by the apparatuses that surrounded them, they could also reterritorialize and/or recode these assemblages in ways that provided redress from some of the harsh effects of slavery, actions which also reshaped the contours of the assemblages they interacted with. To explore this in more detail, we need to combine assemblage thinking with nuanced ways of theorizing slavery. For these, I turn to Black studies, which are introduced in the following chapter.

## Chapter 3: The Ontological Politics of Enslaved Life

[T]he question for theory is how to live in the wake of slavery, in slavery's aftermath, the afterlife of property, how, in short, to inhabit and rupture this episteme with their, with our, knowable lives?
(C. E. Sharpe 2016, 50)

This chapter proposes a new way of thinking about the archaeology of enslaved life that combines assemblage thinking and an explicit focus on materiality with Black studies scholars' insights on how colonialism and racial slavery shape understandings of who counts as fully human. Theorizing enslaved life in this way makes three critical interventions. First, it provides a framework that addresses how enslaved people affected the world around them. Second, it subverts liberal humanism's definition of humanity by seeing how things affected enslaved life, and how different ways of being human get produced in and through assemblages. Third, this highlights Black study's theorizations of metaphysics and ontological difference, countering long-held views that Black scholars' intellectual contributions can only be about race (Sterling 2015; Watkins 2020, 19; also see Jegathesan 2021).

These interventions are needed because archaeologists have not adequately theorized structure and agency in enslaved life, nor have we acknowledged the profound ways liberal humanism shapes our work. There are two dominant treatments of structure and agency in archaeologies of enslaved life (see V. Brown 2009; Ferguson 1992, xliii-xliv). Some studies address the structural forces that affected enslaved people by turning to Marxism (e.g., Delle 2014; Thomas 1998; B. J. M. Weaver 2018), critical theory (e.g., Epperson 2004; Leone 2010; Wilkie and Bartoy 2000), or Michel Foucault (e.g., Delle 2014; Epperson 2000; Singleton 2015a). While these focus on how enslavement, racial capitalism, and sexism affected diasporic Africans, they "silence" enslaved people, as "it is easier to describe... structures of power when
one downplays... [the] activity of the weak" (V. Brown 2009, 1235). In other words, they emphasize structure to the point where agency and life become difficult to see.

Other studies, alternatively, focus on enslaved people making lives for themselves using theories like space and place (Fesler 2010; Heath 2010), selectionism (e.g., Bates 2017; Galle 2010; Neiman 2008), creolization (e.g., Ferguson 1992; Lenik 2009; Samford 2007), risk management (e.g., Odewale 2019; A. L. Young 1997), or practice theory (e.g., Singleton 2015b; Symanski 2012; Wilkie and Farnsworth 2005). How these works approach "the dislocations, physical violations, and cosmic crises" of slavery (V. Brown 2009, 1243) vary widely, from selectionists downplaying enslavement to create generalized models of human behavior to risk management's overemphasis on slavery as the singular force that animated enslaved life. Yet, these studies are ultimately one-sided, seeing enslaved women and men as capable of shaping their own lives and the lives of other enslaved people, but unable to affect the political economies around them. Even studies highlighting resistance (e.g., Ferguson 1991; Orser and Funari 2001; Symanski and Gomes 2016) do not demonstrate that friction generated by enslaved people's agency affected the institution of slavery.

There are exceptions to this, like Mark Hauser's (2008) discussion of how enslaved potters affected Jamaica's economies or Anna Agbe-Davies's (2015; 2018) work on how enslaved Virginian's interactions with tobacco pipes contributed to the development of racial classifications, but these offer narrow views on the far-reaching effects of enslaved people's agency. We need theories that are more expansive and do a better job of tracing out how enslaved people affected the worlds around them. Practice theory (e.g., Bourdieu 1977; Foucault 1988; 1990; 1995; Giddens 1984) should be able to address this since it focuses on how people recursively reproduce structures as they navigate them. But it has failed repeatedly because it
remains firmly rooted in liberal humanism (Weheliye 2014; Wynter 2003). Liberal humanism, as we will see below, defines humans as rational free actors that master the political economies around them, thereby equating humanity writ-large with economically privileged white men. ${ }^{28}$ Practice theorists downplay the rational, free-acting aspects of liberal humanism to highlight the interplay between people and structures (e.g., Bourdieu 1977, 8, 30) but they do not question liberal humanism's definition of white economically-privileged men as the only way of being human (Simmonds 1997). As a result, the historical actors envisioned by practice theorists are endowed with the same capacity for action as contemporary white men. Using practice theory to study slavery projects this understanding of humanity beyond where it can be reasonably theorized (V. Brown 2009; Hartman 1997, 53; W. Johnson 2003; 2011; Kaye 2015).

This brings us to my concern that liberal humanism shapes how we theorize enslaved life. In addition to treating white economically privileged men as a universally applicable model of humanity, liberal humanism discursively strips nonhuman things of their agencies to create a human exceptionalism, preventing us from seeing how people are affected by the materialities around them. There are four reasons we must address the impact of liberal humanism in the archaeology of enslaved life. First, it inadequately theorizes agency and structure within the context of slavery, as discussed above. Second, it ignores how nonhuman things affected enslaved people. Third, liberal humanism is reproduced in and through the violent oppression of Black women, children, and men. Uncritically using liberal humanist frameworks to study these people obscures how this violence impacted enslaved life and how it continues to affect Black

[^22]lives today. Finally, using liberal humanism as our default understanding of the human "decide[s] in advance what" the humanity of the enslaved women, children, and men we study should look like (Weheliye 2014, 2). This prevents us from "com[ing] to a more layered and improvisatory understanding of" the "extreme subjugation" of slavery that would let us see how gaps in the ontological violence enacted against enslaved people created spaces for them to make lives for themselves (Weheliye 2014, 2).

We need theories that subvert liberal humanism and portray enslaved people as historical actors capable of affecting the worlds around them. As I argued in the last chapter, assemblage thinking provides an ideal way of theorizing enslaved people's agencies. It also provides a way of decomposing human exceptionalism by focusing on the agentic capabilities of things and the poetics of friction they engage in within assemblages. Archaeologists are beginning to turn to the new materialism to move beyond liberal humanism's hold on our studies of enslaved life (e.g., Schwalbe 2020), but doing this only solves part of the problem. As Zakiyyah Jackson notes (2020, 15), a "critique of anthropocentrism is not necessarily a critique of liberal Humanism," and the new materialism often advances the political goals of liberal humanism by ignoring the existence of other ways of being human. We need to merge our attempts to move beyond human exceptionalism with theories that subvert liberal humanism's understanding of humanity (Erasmus 2020). To do this, we should align the new materialism and the archaeology of enslaved life with counter-humanism, a line of thought within Black studies that seeks to dismantle liberal humanism. ${ }^{29}$ Counter-humanists have turned to assemblage thinking (Allewaert

[^23]2013; Glissant 1997; Puar 2017; Weheliye 2014), but they have not meaningfully attended to non-biological materiality, likely because they come primarily from "the fields of English, history, and film studies" which focus more on language than the material world (Shange 2019b, 7). This is a widespread problem within counter-humanism, and the few works that do focus on objects emphasize extraordinary things like branding irons or works of art instead of the things people use on a daily basis (e.g., Browne 2015; Lowe and Manjapra 2019). The only exception to this that I am aware of is Mel Chen's (2012) discussion of the racializing effects of lead, but she focuses more on discourses about lead than the effects it has on racialized bodies.

Archaeology, therefore, "can" become "a critical branch" of counter-humanism if we insert our focus on everyday materialities into this radical tradition (Shange 2019b, 7).

In this chapter, I propose an assemblage-influenced, materiality-based counter-humanism that attends to the everyday realities of enslaved life. In other words, I use assemblage thinking to theorize how interactions between discourses, things, people, plants, and animals created definitions of enslaved people as differently and enslaveablely human, and how enslaved people used these same things to redefine themselves as human in their own ways. The first section summarizes how the counter-humanist literature discusses liberal humanism, drawing especially on the work of Mel Chen, Zakkiah Jackson, Alexander Weheliye, and Sylvia Wynter. I also discuss how theories can incorporate the active role materialities play in these assemblages and bring discussions of human exceptionalism into the larger project of counter-humanism. The second section applies this to the study of enslaved lives, especially drawing on Zakkiah Jackson, Saidiya Hartman, and Hortense Spillers.

## Racializing Assemblages and the Production of Human Others

[W]ith being human everything is praxis.... So the question is: What are the mechanisms, what are the technologies, what are the strategies by which we prescribe our own roles?
(Wynter and McKittrick 2015, 34)
Black counter-humanism has a long history, from Baron de Vastley's early- $19^{\text {th }}$-century critiques of the Enlightenment's complicity in colonial projects (Daut 2017) and W.E.B. Du Bois's 1890s work on double consciousness and the color line (1989), to Aimé Césaire's (1972; 1996) and Frantz Fanon's ( 1966 ; 1967) discussions about the racism and coloniality of mid-20 $0^{\text {th }}-$ century humanism. The most prolific counter-humanist, the one who took these earlier works and fashioned them into a unified theory, is Sylvia Wynter, (e.g., 1971; 1984; 1994b; 2003; 2015). Her ideas have profoundly shaped contemporary counter-humanism (e.g., Browne 2015; Z. I. Jackson 2020; McKittrick 2006; Puar 2017; Weheliye 2014) and have heavily influenced the theoretical discussions in Assembling Enslaved Lives. I highly recommend her work.

The overarching goal of Wynter's project is problematizing the praxis and politics of being human by exploring liberal humanism's entanglement with colonization, racial slavery, and capitalism. She redescribes what it means to be human, moving us from our hegemonic conception of the human as a stable entity to seeing humans as contingent hybrids that emerge from our biologies and the stories we tell about ourselves. ${ }^{30}$ This shift has political implications, as liberal humanism is made in the image of, and stigmatizes those who are not, economically privileged white men, while Wynter's hybrid counter-humanism allows for a multiplicity of equally valid ways of being human.

Wynter's definition of humanity focuses on people's unique storytelling abilities. Since we started telling stories about ourselves, these narrations have defined what it means to be human and how we relate to others (Wynter 2015, 217). Such stories do not override biology, which forms the "first set of instructions" that shape our actions (Wynter and McKittrick 2015,

[^24]26-27). Storytelling merely creates a "second set of instructions" that generate categories of symbolic life and death through which we understand ourselves and the people around us. Building on Judith Butler (J. Butler 1993; 1999), Wynter argues that we performatively enact these stories, making being human a praxis, a way of reiterating particular modes, or "genres," of the human (Wynter 2015, 195-96; Wynter and McKittrick 2015, 23). In other words, we are biological creatures living in material worlds, but we compose and inhabit the ontological category of the human through the stories we tell (Wynter 2015). And this is something all humans have been, and continue to be, engaged in since we gained the ability to tell such stories.

Humans pay two prices for our ability to make ourselves. First, our narrations perform a cut in the fabric of humanity, creating a "misrecognition of human kinship" that divides people into a "We/Us" who count as symbolically alive full humans and a "They/not-Us" that become our symbolically dead human others (Wynter 1994b, 69; 2015, 220). These others are not inhuman but defined as differently (and often inferiorly) human and our ability to see ourselves as fully human exists only in reference to these abject others (Z. I. Jackson 2020, 20). In other words, we define ourselves as (fully) human by comparing ourselves to other people we have defined as differently and incorrectly human. Second, our existence as (full) humans is so entangled in these stories that we lose the ability to see the role we play in drafting them. Instead, we credit extra-human agencies (gods, laws of nature, etc.) as the authors of our narrations (Wynter 2015, 217-18, 225-27). This naturalizes the split between full humans and human others and any inequalities that emerge from this divide.

At this point, we need to make three modifications to Wynter's work. The first, proposed by Alexander Weheliye (2014), is approaching Wynter's narrations as assemblages, as a repeated coming together of, and interactions between, people, things plants, and animals which create
racial categories that "apportion and delimit which humans can lay claim to full human status and which humans cannot" (Weheliye 2014, 3-4). This shifts our view of race from "a biological or cultural classification" and towards "a set of sociopolitical processes" that must be continually recited if these ontological categories are to be maintained (Weheliye 2014, 3). This need for repetition means that racializing assemblages are contingent. If they do not repeat in particular ways across time and space they lose their tautness, allowing new ways of being human to emerge from them (also see J. Butler 1993; 1999). This turns ideas about race into a perpetual ontological "politics of being... waged over what is to be the descriptive statement[s] of the human" and its other (Wynter 2003, 318, my emphasis). Wynter specifically sees these politics as taking place when new definitions of the human emerge, like the transition from Man1 to Man2 (see below). However, if we read Wynter through assemblage thinking or the work of Judith Butler, we see these politics perpetually take place, because without them these definitions fall apart. This lets us see the ontological politics of being as continually enacted in and through everyday life.

The second modification is recognizing the critical role things play in racializing assemblages. While we may presume that other species do not narrate themselves, we have no way of knowing for sure. But we are the only species that use things to tell stories about ourselves (Strum 2012). While Wynter recognizes this (e.g., Wynter and McKittrick 2015, 6269), she primarily focuses on linguistic aspects of storytelling. We can strengthen Wynter's argument by addressing how discourses and materialities get created in and through one another (also see Watkins 2021). As humans, we are constantly being (re)composed within sociomaterial assemblages. While this is a symbiotic process, involving people, plants, animals, and things (Haraway 2016), making sense of and narrating assemblages is an act of self-making (or what

Wynter calls autopoiesis) where people choose what parts of these assemblages to emphasize and which to downplay (Trouillot 1995; Wynter 2015). For instance, Mel Chen (2012) notes that news coverage of lead poisoning among white suburban and Black inner-city children differ, emphasizing different parts of these assemblages to talk about these children as ontologically different. While lead affects both groups in the same way, cognitive and behavioral issues from lead exposure get cited as a reason why white children may not achieve the economic success required to become fully human within liberal humanist frameworks, while these same cognitive and behavioral effects are seen as personal failings among Black children and cited as evidence that they are inferiorly human (also see Wynter and McKittrick 2015, 27). Furthermore, since Black families are more likely to live in homes with lead paint (e.g., Gioielli 2010; Lanphear et al. 1996; Pirkle et al. 1998), the material effects of living in these racialized spaces can be seen as yet another way race become biology (Gravlee 2009).

Chen's work highlights the agentic role things play in defining full humans and their others, as the way lead recomposes Black bodies reiterates discourses that define Black people as inferiorly human. This makes materialities "maternal" in that they "reproduce" discourses and the ways of being human they create (Moten 2003, 16), both through the material components of discourses and in the ways their materials/biological effects come to reiterate racial classifications. Wynter $(2003,267)$ makes a similar argument about the political economies that created liberal humanism bringing economic prosperity to those deemed fully human, reinforcing their belief in their superior status, while "produc[ing] material deprivation" on the part of its human others that "legitimize[d] the[ir] subordination." In other words, the material world is shaped by the way we enact our humanities while creating material conditions that recursively naturalize these ways of being human.

Finally, folding materiality into Wynter's work requires a more expansive view of who/what can be the subject of our narrations. Wynter sees these discourses as creating full humans and their human others. But with materiality, we must see these as creating the ontological category of the (full) human in and through its relation to its human others and its relation to nonhuman animals, plants, and things. This brings the important insights of new materialism and its dismantling of human exceptionalism (e.g., Barad 2007; Bennett 2010; Latour 1993; 2005) into counter-humanism, creating a multifaceted approach that subverts liberal humanism on two fronts.

## Creating Liberal Humanism and its Others

No, no. That's not the way. I told you to put her human characteristics on the left; her animal ones on the right. And don't forget to line them up.
(Morrison 2004, 228)
Before their $15^{\text {th }}$-century colonial expansion, Europeans described humanity in JudeoChristian terms "based upon degrees of spiritual perfection/imperfection," expressed as the Great Chain of Being (Wynter 2003, 287). Those who accepted Christianity became fully human, while "heretics" who rejected it became enslaveable human others. Through colonization the European homo religiosus encountered Indigenous people who could not have rejected a religion they had not known, placing them outside the Christian-or-Heretic description of humanity and rendering them unenslaveable (Wynter 2003, 293; 2015, 227). However, new racializing assemblages emerged from debates about how to subjugate Indigenous people. These created a new way of being human, which Wynter calls Man1, that secularized the Judeo-Christian Chain of Being, creating "differential/hierarchical degrees of rationality... between different populations" (Wynter 2003, 300-301; 2006, 122). Citizens of European nation-states occupied the most rational position while sub-Saharan Africans were relegated to the lowest rung. For
instance, a $19^{\text {th }}$-century agricultural journal that circulated in the Shenandoah Valley stated that "in the variety of God's creations... the negro was formed as the connecting link between the white man and the brute species" and is not always "superior to speechless animals of lower grade" (American Farmer 1839b, 234). Zakiyyah Jackson (2016; 2020, 22, 27) argues that this ontological position "burdened" Africans "with the specter of abject animality," defining them as "animals occupying human form" residing at "the living border dividing" humans from nonhumans (also see J. L. Morgan 1997; 2004). This language, for instance, is seen throughout John Pendleton Kennedy's Swallow Barn (Kennedy 1853, 107, 138, 308-10, 326-27, 446), a novel set in eastern Virginia but based on the author's experiences visiting his family's Shenandoah Valley plantation. This bestialization of Black humanity rendered them differently and inferiorly human, with the opposition between Black peoples' fleshy animality and white men's (supposedly) ethereal rationality allowing the fully human homo rationalis to be defined (Z. I. Jackson 2020, 6).

Gender also played a role in these racializing assemblages. As new definitions of the human were being composed, European men projected pre-colonial discourses about women's irrational carnality onto non-white men (Wynter 1990, 356-60). Wynter (1990, 356) argues that this linking of white womanhood and Black manhood made Black women illegible (or demonic, see Chapter 1) within the "system of meaning" that governed the politics of being within colonial projects. This illegibility, however, was situational, making Black women visible only when putting them "at the bottom of the human/animal chain" - a position so rooted in corporeal sexuality that rational self-reflection was considered impossible - was needed to serve as a point of reference for the fully human homo rationalis (Z. I. Jackson 2020, 9-12).

Seventeenth-century European philosophers and scientists expanded these ontological politics of being to include plants, animals, and things. Before this time nonhuman things were considered agentic, capable of affecting and being affected by the world around them (Latour 1993). During the Enlightenment, however, new ontological categories of "culture" and "nature" were created. These were defined as "entirely distinct" and utterly secularized "ontological zones," preventing things and animals from being seen as active participants in social life (Latour 1993, 10-11; Wolfe 2003). Bruno Latour (1993) sees this as the start of (liberal) humanism, as this is where humans first became exceptional beings whose actions were unencumbered by the materialities around them. He further argues that humanism's origin was not influenced by colonialism and slavery.

Counter-humanists, however, show that liberal humanism was a by-product of the racializing assemblages that created Man1. Latour (1993, 30-33), for instance, argues that modernity's secularized world views came from the intentional removal of supernatural agencies to "intervene in any way" in nature or culture. Yet, as Wynter shows (2003, 299), this secularization dates not to the $17^{\text {th }}$ century but to $16^{\text {th }}$-century definitions of the human that allowed Indigenous Americans and Africans to be violently subjugated and enslaved. Furthermore, Jackson (2013; 2015; 2016; 2020, 13), writes extensively about the "necessity" of considering how "the abjection and bestialization of" Black humanities created the "rational, self-directed, and autonomous" forms of humanity that white people claimed for themselves. While Latour sees the homo rationalis as emerging in Europe's salons and laboratories, Wynter and Jackson demonstrate that it originated in the brutal violence and ontological terror of colonialism and racial slavery. Without these secularized forms of racial violence, understandings of humanity that separated homo rationalis from nonhumans could not have
come into existence. Once these refined definitions of the homo rationalis emerged, they fed back into the colonial projects that created them, with indigenous and Black peoples' continued recognition of nonhuman agency becoming evidence of their supposed inferiority and irrationality (Latour 1993; Murray 2007).

Mel Chen (2012) uses the concept of animacy to argue that racializing assemblages use the same discourses to objectify and misrecognize the agencies of human others and nonhuman things. Animacies, or how we discuss and understand agencies, create "conceptual orderings of things, an animate hierarchy of possible" actors that contingently classify some (non)humans as fully agentic beings capable of shaping the world around them and other (non)humans as lacking the ability to do so (Chen 2012, 10). ${ }^{31}$ For example, one person could be described as being able to handle their alcohol, making them more agentic than the intoxicating liquid, while another could be described as caught in its grip, positioning them as less agentic than alcohol and less agentic than the person who can hold their liquor. Within liberal humanism, these discourses repeat in ways that consistently define those deemed fully human as more agentic than human others. Within racializing assemblages, the use of animacies to describe human others and nonhuman things as less agentic than full humans creates exceptional white subjects who alone shape the social worlds they inhabit.

Despite these discourses, the new materialism demonstrates that nonhuman things act on people and affect our lives (e.g., Barad 2007; Bennett 2010; Haraway 2008; Latour 2005), just as Fred Moten $(2003,1)$ argues that " $[t] h e ~ h i s t o r y ~ o f ~ b l a c k n e s s " ~ t e s t i f i e s ~ " t o ~ t h e ~ f a c t ~ t h a t ~ o b j e c t s ~$ can and do resist." But, just recognizing the agency of nonhuman things does not address the

[^25]racialized ways of being human that prefigured the Enlightenment's intellectual project (Z. I. Jackson 2013, 671-72; 2020, 15; López 2018). And only addressing racializing assemblages does not counter the ontological divide between nature and culture. To combat liberal humanism, we must address both. But doing this requires reckoning with the universalizing aspirations these logics later acquired.

The theocentric human-as-Christian allowed people to be human in different ways by believing in other (albeit "false") gods (Wynter 2003, 299). But the secularized description of Man1, with its notions of rationality, was more malleable, capable of being stretched into an intolerant monohumanism that could advance colonialism and racial slavery by proclaiming its universality. This stretching was accomplished through a "sustained rhetorical strategy" that equated Man1 with humanity writ-large, and constantly and pragmatically redefining Man1 and its human others to fit new colonial situations (Wynter 2006, 123-26).

Capitalism, social Darwinism, and the abolition of slavery dramatically expanded these universalizing discourses in the $19^{\text {th }}$ century. ${ }^{32}$ During this time European bourgeoise replaced the hierarchical chain of being that slotted people into pre-defined rungs based on notions of rationality with a new privatized/individualized way of being human that Wynter calls Man2. Within this schema, being able to master natural scarcity and liberal free-market economics became the marker of one's status as a naturally selected fully human homo economicus (Wynter 2003, 314-15). The human other to Man2 were those who due to centuries of racial, economic, and gendered oppression could not become patriarchal "jobholding Breadwinner[s]," adding women, the criminalized, the jobless, and the working poor to this now extra-racial category

[^26](Wynter 1994b; 2003, 321). Yet, inside the newly defined human other, remnants of Manl's irrational other remained, using new notions of evolutionary/genetic fitness and its supposed relationship to intelligence to slot people of color into even-less-fully-human positions relative to white human others (Wynter 2003, 322-23). Removing predefined rungs from the definition of humanity made the homo economicus truly universal, casting liberal humanism as the only accepted way of being human, even if it is still defined with only one type of person in mind. This transforms the act of being human differently (through choice or through simply not being a white man) into a "self-alienati[ng]" "wrongness of being," a simultaneous expression of being normally human (Homo sapiens) and abnormally human (not homo economicus).

Because Blackness has been defined as the lowest rung of humanity for centuries, and because without Blackness liberal humanism could not create its definition of the human, Black studies is critical for understanding and overturning liberal humanism (Wynter 1994a; 1994b; 2006; also see Weheliye 2014). This counter-humanist project seeks to "utterly de-legitimize" liberal humanism by exposing its reliance on "strategic mechanisms that... repress all knowledge of the fact that" its definition of humanity as homo economicus is nothing more than a story we tell ourselves so certain people can be violently exploited by others (Erasmus 2020; Wynter 2003, 326; 2015, 207). By denaturalizing Man2 and showing the inequalities it supports we can install "an alternative... version of humanness imagined outside liberal monohumanism" where all ways of being human are considered equally valid (Wynter 2015, 230-31; Wynter and McKittrick 2015, 11).

Archaeologists can engage in this counter-humanist project by asking "[w]hat are the mechanisms... technologies... [and] strategies by which [people] prescribe our own roles" as humans (Wynter and McKittrick 2015, 34). If we can show that different mechanisms,
technologies, and strategies created different genres of the human throughout time then our evidence can be used to show that Man2 is not the only way of being human. This does much of the same work as archaeology's engagement with the ontological turn (e.g., Alberti 2016; Cipolla 2019; O. J. T. Harris and Robb 2012) but exceeds current ontological frameworks by addressing how people understood themselves and the worlds around them and the politics of being through which people constituted themselves as fully human.

Explicitly addressing these ontological politics is critical for the study of enslaved life because our work is enmeshed within the discourses that created both Man1 and Man2. Man1 and its irrational, bestial human others play an important role when studying slavery because it was this definition of the human that allowed enslavers to define diasporic Africans as enslaveable human others and to accrue the "wages of whiteness" (Du Bois 1976; Roediger 1991) from the abjection they projected onto enslaved people. However, "definitions belong to the definers - not the defined" (Morrison 2004, 225; also see Baldwin 1993, 4), so we cannot simply assume that enslaved people accepted the ways enslavers defined their humanities. Instead, they enacted a counter-politics of being wherein they defined themselves as human in their own ways (e.g., Allewaert 2013; Hartman 1997; T. L. King 2019). The artifacts, landscapes, and documents we look at when studying slavery speak directly to these contested definitions of enslaved humanity because they were important components of these discourses.

While these ontological politics played out in the past, how we understand them in the present is shaped by the universalizing discourses surrounding Man2. Archaeology plays a role in perpetuating this universalization when we fail to acknowledge other ways of being human by determining in advance what the ontological category of the human looks like. We can see this with the cultural-evolutionary turn in the mid-20 ${ }^{\text {th }}$ century (e.g., Binford 1965; Flannery 1968;

Hill 1970) and the subsequent rise of behavioral ecology and selectionist archaeologies (e.g., Bird and O'Connell 2006; Dunnell 1980; Lyman and O'Brien 1998), all of which approach past people as homo economici rationally responding to the environments around them. Using this theoretical position to study enslaved women and men (e.g., Bates 2017; Galle 2010; A. L. Young 1997) means that we can only show enslaved people's humanity by demonstrating that they too were breadwinning homo economici. Not only does this reiterate the universality of Man2, it threatens to define enslaved people as abnormally human if they do not meet the unreasonable standard we set for them. Even if we reject the particulars of the homo economicus, as many studies of enslaved life do (e.g., Singleton 2015b; Symanski 2012; Wilkie and Farnsworth 2005), we elide "how humanity [was] imagined and lived by those" defined as differently human if we do not also reject the assumption that there is only one way of being human (Weheliye 2014, 8). This also means that we cannot assume that enslavers acted as rational, self-interested homo economici in the same way that this category has been defined in the $20^{\text {th }}$ century (contra Fogel 1985; Fogel and Engerman 1974; Neiman 2008) because their definitions of what it meant to be human, and to be a rational actor, were different than our own.

To come to a fuller understanding of what enslaved life was like we must subvert the singular definition of humanity offered by liberal humanism and explore the myriad ways people defined, inhabited, and rejected definitions of what it means to be human.

## Enslaving Assemblages and the Poetics of Enslaved Life

The particular assemblage of humanity under purview here... insists on the importance of minuscule movements, glimmers of hope, scraps of food, the interrupted dreams of freedom found in those spaces deemed devoid of full human life."
(Weheliye 2014, 12)
Slavery, as Hortense Spillers $(1987,67)$ argues, violently disrupted the "point of convergence" where Black people's "biological, sexual, social, cultural, linguistic, ritualistic, and
psychological fortunes" came together (also see Allewaert 2013). Decomposing these people$q u a$-assemblages laid bare their fleshy materiality and disrupted how diasporic Africans narrated and defined themselves, allowing them to "be arranged and rearranged for infinite kinds of use"
(T. L. King 2016, 1025; Spillers 1987). Saidiya Hartman (1997) and those influenced by her (e.g., T. L. King 2016, 1023; 2019; Rifkin 2019; Snorton 2017) refer to this "unfettered exchangeability and transformation" as fungibility. Such "(re)imagining[s] [of] Black bodies’ relationship[s]" to the violent political economies around them highlights the "pure flux" of enslavement, the unstable and perpetually shifting ways of being human enslaved people were violently ushered through (T. L. King 2016, 1022-24). ${ }^{33}$ The fungible (re)composition of Black bodies played out in all aspects of enslaved life. As Barbara Omolade $(1983,354)$ writes:
[E]very part of the black woman was used by [her enslaver]. To him she was a fragmentary commodity whose feelings and choices were rarely considered: her head and her heart were separated from her hands and divided from her womb and vagina. Her back and muscle were pressed into field labor where she was forced to work with men and work like men. Her hands were demanded to nurse and nature the white man and his family as domestic servant.... Her vagina, used for his sexual pleasure, was the gateway to the womb, which was his place of capital investment - the capital investment being the sex act, and the resulting child the accumulated surplus, worth money on the slave market.

Black fungibility recomposed notions of gender, adding temporal dimensions to enslaved
womanhood (Omolade 1983, 364). By day enslaved women's limbs and muscles were highlighted as they performed physical labor that produced profits and comfort for their enslavers. By night their sexual organs were emphasized as enslavers violently imposed their carnal desires onto enslaved women to forcibly reproduce the "capital investment" of slavery

[^27](Hartman 2016; T. L. King 2016; also see Byrne 2003). The entanglement of enslaved people and the political economies of slavery was enacted through a lifelong monetization of Black flesh (Berry 2017; Spillers 1987). John Adams (1872, 8-9) described this process in Frederick County, recalling that "[y]ou would see them [his enslavers] going around... put[ting] their hands on one of the little negroes... say[ing] 'here is $\$ 1,000$, or $\$ 1,500$ or $\$ 2,000$.'" Parts of enslaved people's bodies were also picked out and used to violently terrorize their peers (V. Brown 2008). In 1763, Tom, an enslaved man convicted of shooting a white Shenandoahans, was decapitated and his severed head affixed to a pole placed along a major road in Augusta County (Simmons 1997, 166). Similarly, in February 1780, Violet, an enslaved woman, was executed for arson and her severed head was "stuck upon a pole in the public place near Staunton" (Noyalas 2021, 21). And in December 1807 Frederick County paid a local physician to castrate Joe, an enslaved man convicted of attempted rape (McKay 1808, 564). ${ }^{34}$

This fungibility allowed enslavers to create ever-shifting definitions of Black women, children, and men as differently and enslaveably human. As a result, we must see "slavery [as] a technology for producing" and describing "a certain "kind of human" that could be enslaved, a homo servus whose dispossession allowed those enacting this violence to extract wealth and status from Black flesh (e.g., Benjamin 2018b; Du Bois 1976; C. I. Harris 1993, 1717-18; Hartman 1997; Z. I. Jackson 2016, 96; Judy 2020). These views about enslaved people's humanities were recited throughout the Antebellum South (e.g., C. Jones 1828, 273; J.S. 1841a, 138; Kennedy 1853; Stephens 1861; Williams 1859, 35; Wray 2006, 61). And this type of enslaveable human other was understood to be different than other racialized forms of humanity (also see T. L. King 2019). For instance, a Shenandoah Valley newspaper published a story

[^28]decrying the "import[ation] and hir[ing] out" of Indigenous Mexicans "as slaves... their owners being allowed to whip them in the same manner as negroes" because while "Indians, no doubt, are troublesome in Yucatan... selling them into slavery is a wicked way of getting rid of them" (Spirit of Jefferson 1853b, my emphasis). ${ }^{35}$ While the author argues that Indigenous women and men do not have a right to their land, hence the concern over their enslavement and not the idea of "getting rid of them," they put Indigenous people in a different ontological category than Black people, who can be enslaved and whipped. These ontological politics took place throughout the Atlantic world - in slave ships, plantations, market towns, and capital buildings. It was an all-encompassing fact of life wherever slavery was practiced and wherever the wealth produced by enslaved women and men accumulated.

Assembling Enslaved Lives addresses how these political economies played out in the Shenandoah Valley. But to do this, we must discuss the mechanisms that reproduced these enslaving assemblages. Like all assemblages, no component determined if and how enslaving assemblages repeated across time and space (Bennett 2010). They resulted in enslavers accumulating power and wealth and enslaved people accumulating scar tissue and emotional trauma, but these accumulations and the definitions of the human that guided them were contingent and relied on a variety of factors. But this does not mean that enslaver's greed was not important. Without a greedy desire for profits and status enslaving assemblages could not have operated. Similarly, the forms of humanity these assemblages produced were not teleological, playing out with a certain end in mind. Instead, these were ontologically plastic, with the forms of humanity inhabited by enslaved people being radically recomposed in whatever way was

[^29]needed to continue the repetition of enslaving assemblages and the forms of humanity they generated (Z. I. Jackson 2020, 10).

As a result, discourses about enslaved humanity took a variety of often contradictory forms in the Shenandoah Valley that were united solely by their attempts to define Black people as differently and enslaveablely human. For instance, white Shenandoahans could read descriptions of enslaved people in newspapers and agricultural journals which argued that "gearing and ungearing" horses was beyond "the genius of the negro" and that enslaved people "possessed... a degree of emulation" and intelligence "equal" or even "superior" to "white laborer[s]" (T. P. Jones 1827, 298; Skinner 1825, 3; J.S. 1841a, 138). Similarly, enslaved people could be defined as literal "animal[s]" who produced the same "secretion[s]" as sheep and as the "least observant" and most "heedless, thoughtless human being" among whom there was "almost an entire absence of moral principle" (American Farmer 1829, 113; Gooch 1833, 139; Tayloe 1837). Arguments that defined the enslaved as differently human based on morals and intelligence were used alongside newer biologically-based definitions of race that began in the early-19 ${ }^{\text {th }}$ century (Franklin 1820; 1839; W. H. Harrison 1832; Home 1821) based solely on what worked at the time. And secularized arguments that justified slavery using examples from the natural world were used alongside older religious arguments for slavery that were radically called forth to fit enslavers' needs (Adams 1872, 19-20; Farmers' Register 1836; Newman's History of Insects 1847; Veney 1889, 7-8; Winchester Virginian 1849). ${ }^{36}$ In other words, we see

[^30]perpetually shifting definitions of diasporic Africans as differently human based on the role these definitions were required to play in specific discourses.

Hartman (1997) further argues that this plasticity can be seen in enslavers' discourses about enslaved people's agency. As noted earlier, liberal humanism uses regimes of animacy to render Black people as differently and inferiorly human by describing them as less agentic than fully human white subjects. But at times enslaved peoples’ agency was made legible to create "forms of subjectivity and circumscribed humanity" that intensified enslaving assemblages (Hartman 1997, 6). Hartman notably points this out in discussions of sexual assault, where enslaved women's (possible) agency was recognized by enslavers to a limited degree to construe these women as consensual participants in their rape, while the recognition of agency during trials of enslaved men accused of sexual assault was used to criminalize them (Hartman 1997, 94). Dancing was also an act wherein enslaved people's agencies were acknowledged to advance slavery, as forcing Black women and men to dance for their enslavers amusement made "the slave... appear as if born to dance in chains" (Hartman 1997, 42-47). These contingent recognitions of agency took place in the Shenandoah Valley. Bethany Veney (1889, 8-9) mentions that during her childhood in Page County her enslaver:
had a way of entertaining his friends by my singing and dancing. Supper over, he would call me into his room, and, giving me to understand what he wanted of me, I would, with all manner of grotesque grimaces, gestures, and positions, dance and sing.... many... songs....

Similarly, Adams $(1872,19)$ recalls that if an enslaver's child "got a little hurt all the negroes on the plantation had to run and pick up the child and kiss and pet it," acknowledging enslaved people's agency as it related to caring for enslaver's children.

Many studies, particularly those influenced by Orlando Patterson's social death (1982),
Michel Foucault's biopolitics (1990; 2008), or Giorgio Agamben's bare life (1998) focus solely
on the abject ontological categories enslaved people were slotted into (e.g., Olaloku-Teriba 2018; Sexton 2015; Warren 2018; Wilderson 2020). Doing so critiques enslavers' refusal to recognize enslaved people as fully human, but it does so by "neglect[ing] and/or actively disput[ing] the existence of alternative modes of life" that emerged "alongside the violence, subjugation, exploitation, and racialization" of enslavement (Weheliye 2014, 1-2). This also leads us to the same position as structure-centric archaeologies, overemphasizing oppression to the point where life becomes impossible to see (V. Brown 2009, 1235). And as Katherine McKittrick $(2014,18)$ argues, if we only look at "death and violence" then the "stories we tell" can only produce "knowledge about... black subjects that render... them" as people who suffered, but never truly lived (also see Hartman 1997; Spillers 1987). As such, it is vitally important that we keep this "livingness" (sensu McKittrick 2021) in our studies of enslaved lives.

When we carefully attend to enslaving assemblages, we see enslaved people decomposing the ontological category of the homo servus as they made lives for themselves. We cannot separate such acts from the wanton brutality inflicted on Black women, children, and men, as violence and "[p]ain [are] normative condition[s]" of enslavement" (Hartman 1997, 51). But this ontological trauma, and the ways it oriented enslaved women and men relative to the other parts of enslaving assemblages, created possibilities for making lives within it (ChudeSokei 2018, 47; Glissant 1997; C. E. Sharpe 2016; Weheliye 2014; Yountae 2014, 291). Painful, traumatic lives, but lives all the same. We can follow Hartman $(1997,76)$ in describing acts that provide "relief, restitution, or recover[y]" by (re)assembling and (re)describing oneself in the face of Black fungibility as redress. Redress is what allowed enslaved people to make lives for themselves. It did not remove them from pain and violence, nor did it stop enslavers from defining Black women, children, and men as differently and enslaveably human. But it did allow
for "alternative configurations of the self and the redemption of the body as human flesh, not beast of burden" (Hartman 1997, 51, 77). To put it in Wynter's terms, acts of redress were a counter-politics of being wherein enslaved people (re)described themselves as human in their own ways, or at least in as much of their own ways as possible within the confines of slavery.

The counter-politics of enslaved life took many forms. Assembling Enslaved Life explores how hunger, market towns, ceramics, yard spaces, and cellars played important roles in the ways enslaved Shenandoahans redefined themselves as human. But for the time being, let us explore three quick examples of these counter-political acts of redress in the Shenandoah Valley. Adams $(1872,15)$ recalled that his enslavers "took my labor to educate their children, and then laughed at me for being ignorant and poor, and had not sense enough to know that they were the cause of it." They denied him education and then used this lack of education to define him as intellectually inferior and enslaveablely human. In response, Adams talks at length about the importance of education, how his brother bribed white children with apples to teach him to read, and the satisfaction he felt at being literate despite his enslavers' objections - acts that redefined him as intelligently human. The second example comes from an unnamed woman enslaved in Rockingham County's Tenth Legion neighborhood (Slave Poem n.d.). Her children were taken from her, and she was punished for trying to get them back. Later, she wrote a poem recounting her experiences and defining herself as someone this should never have happened to:

If I was wite as some folkes are,
I'd hab a chance to live:
But I is black, all over black
So wite folkes hab a chance to swear
They take my little niggies way
And bind dem also tight
When want to get dem back again
I is de Debble of de day

De sheriff comes mid men and clubs
To take me like a teif
Dey curse, dey swear, dey knock me down
Like [illegible] ketch bear wid dogs and clubs
Right in de parsons house dey go
Right were de ladies are
Dey skear dem all and make dem mad
Before dem all dey knock'd me so
Dey takes me off before de judge
De people all around
Dey swear, dey lie and I must hush
I dare not move, nor dare judge
Den I is wipt right on my back
And no one pities me
Wat I have done no one can tell
Now I is wipt couse I is black
Tenth legion is a braggy place
Were none's to be king
Were 'spect is paid to ladies fair
As you can see in old niggies case
Finally, we recovered 91 adornment artifacts from our excavations at Quarter Site B at Belle Grove Plantation (see Chapter 4). Among these are five beads, three comb fragments, a copper-alloy bracelet, the silver-plated setting for a ring, a fan blade, and parts to two different parasols. These speak to enslaved women reassembling their bodies using jewelry, combs, beads, fans, and parasols, letting them present themselves as they wanted (Camp 2002; 2004; Thomas and Thomas 2004). A lot of these are fairly unique items, allowing these women to be easily differentiated from one another. Who is the woman with the bracelet? Oh, you must be talking about Judah. Whose fan is that? It belongs to Sucky. Who is that woman with the parasol? If it is the yellow one that is Sally, if it is the blue that is Truelove. In this way, the women created their own definitions of humanity, one that did not see themselves as fungible but as people with different needs, desires, tastes, and senses of style.

We must take care not to define all counter-politics as acts of resistance. Certainly, some were, and I do not mean to diminish these. But I do not think that we can classify the quotidian practices discussed in Assembling Enslaved Lives as acts of resistance. Instead, we should see these counter-politics as the poetics of enslaved life, as ways of making do within slavery (sensu de Certeau 1984) that redressed the pain of being pulled apart, recomposed, and rendered differently human instead of practices aimed at overturning the institution of slavery (also see Reilly 2019, 39; Silliman 2001; 2014). Jenny Sharpe (2003, xvi-xxiii) and Alexander Weheliye (2014, 2) further argue that focusing on resistance hinders us by implying certain motivations behind actions, by casting these motivations as always already fully-formed and "working against something or someone," and by setting these actions up for defeat when we fail to demonstrate that resistive motivations generated resistive effects.

Jackson (2020, 4, my emphasis) refers to ontological counter-politics as "[u]nruly but generative conceptions of being." This generative aspect is critical because it lets us address how the ways enslaved people redefined themselves as human affected the world around them. For instance, enslaved people bought things from local merchants that they used to redefine their humanities, and these acts of consumption affected the local economy. These actions could produce what Tiffany King (2019, 2) calls "shoals," "thought[s], movement[s], aesthetics, resistance, and lived experiences" that "chaf[fed] and rub[ed] up against the normative flows of Western thought," disrupting enslaving assemblages and the definitions of the human they relied on. But, we also need to recognize that these generative effects could also inadvertently advance the enslaving assemblages that violated these women, children, and men, which we can see through a close (re)reading of Hartman's (1997) discussions of slavery, subjectivity, and agency.

Hartman (1997, 54-55, my emphasis) explicitly argues that enslaved people could not have reproduced the institution of slavery:

Slavery is characterized by direct and simple forms of domination [and] the brutal asymmetry of power... that make it difficult, if not impossible to direct one's own conduct, let alone the conduct of others. As Foucault remarks, 'There cannot be relations of power [as opposed to domination] unless the subjects are free'.... In a state of domination, the operations of power appear more repressive than productive, and the attendant forms of subjugation seem intent upon preventing the captive from gaining any measure of agency that is not met with punishment.

In other words, Foucault focuses on how subjects reproduce political structures through daily practice because of their ability to exert agency without being punished. Hartman argues that enslaved people do not meet the conditions needed to see them as Foucauldian subjects whose actions reproduced enslaving assemblages because "any measure of agency" was punished.

However, Hartman undermines her argument by discussing at length how enslavers coopted enslaved people's agencies (see above). Some of these agencies were punished, but others were encouraged. Part of the disconnect between my reading of Hartman and what I believe she was trying to convey is her definition of agency as an "exercise of the will" that is "determined by, exploit[s], and exceed[s] the constraints of domination" (1997, 54-55). In addition to being mired in questions of intentionality (Giddens 1984), Hartman focuses on the structure-determined forms of agency available to enslaved people but ignores the effects these agencies had on the structures that generated them. Taken to its logical conclusion, this definition of agency-qua-intentionally separates cause from effect to the point where we lose the ability to see what enslaved people did and the effects these doings had. This reproduces regimes of animacy that defined enslaved people as unable to affect the worlds around them (Chen 2012). But if we see agency as the ability to affect and be affected by the world (e.g., Despret 2013; Giddens 1984; Latour 2005) then we see enslaved people being forced to dance as agency, as
things they did (willingly or unwillingly) that affected and reproduced enslaving assemblages. This provides a fuller understanding of slavery by addressing how enslavers coopted the ways enslaved people affected the world around them to ensure that enslaving assemblages maintained their tautness as they repeated across time and space.

But to see this, we must return to Hartman's argument that "any measure of agency" by enslaved people was "met with punishment" by asking how a system as repressive as slavery could recognize and coopt enslaved people's agency? Here, Jackson's discussion of the ontological plasticity of enslaved humanities is crucial. Enslaving assemblages reproduced forms of humanity that allowed some people to profit from the abjection of others. So long as these forms advanced this goal, the contours of their being did not matter. If enslaved people's agencies could be pulled back into and recomposed with definitions of the human that advanced slavery, this could be done without any apparent contradiction. This made enslaved life itself fungible, with enslavers "salvaging"(sensu Tsing 2015, 63) the ways enslaved people sought to make do within the confines of slavery, recomposing these actions and their effects to generate new forms of slavery. Since acts of redress primarily took place outside of forced labor regimes, this made "[t]he hours from sundown to sunup" just "as important as those spent in the field" when it came to the repetition of enslaving assemblages (Hartman 1997, 45).

This is not a comfortable position, as it threatens to pervert how we talk about enslaved life. It is dark and grimy. But so was slavery. If we insist on sanitizing slavery by looking at enslaved people's agency without acknowledging the ways enslavers could twist their actions around and used them to perpetuate the institution of slavery, we cannot adequately theorize it. I want to make it clear that I am not blaming enslaved people for enslavers manipulating their actions. The conditions of slavery and enslavers' desires for profit and possession are to blame
(Hartman 1997, 47). Enslaved people were simply trying to find some way, any way, to seek redress by redefining their humanities and making lives for themselves within enslaving assemblages.

With this understanding of enslaving assemblages and the generative (counter-)politics of being that took place within them, we are ready to start looking at enslaved life in the Shenandoah Valley. But first, we must look at the sources of data we will use in this endeavor.

## Chapter 4: Belle Grove Plantation

Historical archaeology in the Shenandoah Valley began in the 1970s. While relatively few studies have addressed life in the mid-18 ${ }^{\text {th }}$ century (e.g., Hofstra and Geier 1996; 2000; Jolley 2002; 2005; 2013), later periods have received more attention. Research on the late- $18^{\text {th }}$ to mid $-19^{\text {th }}$ centuries generally addresses the region's industries - including ceramic production (Bloch 2015; 2016; Jolley 2004; Russ 1995; 1999; Russ and McDaniel 1986; 1991b) and iron foundries (Ellis 2010; Russ et al. 2000) - or life at Liberty Hall Academy, a local Presbyterian college (modern-day Washington and Lee University) (Bloomster et al. 1987; Galke 2006; A. Jackson 2007; McDaniel and Potter 1978; 1980; McDaniel and Russ 1989; McDaniel et al. 1979; Russ and McDaniel 1991a). ${ }^{37}$ While everyday life in the Valley's rural areas has received less attention, archaeologists have discussed identity, consumption, and the changes brought by the region's growing participation in global wheat markets (Bednarchuk 2006; Fennell 2003; 2017; Higgins 2005; Hofstra and Geier 2000; McDaniel and Gregory 1999; McDaniel and Potter 1978; McDaniel and Russ 1984).

Like historians, archaeologists were slow to study slavery in the Shenandoah Valley. By 2010, only one building inhabited by enslaved Shenandoahans had been identified and excavated (Higgins et al. 2001). However, discussions of the Parnassus farmstead, the Augusta County property associated with this dwelling, primarily focus on the farm's white inhabitants (Higgins et al. 2001; Higgins 2005), and the authors do not clarify if this stems from a lack of data associated with the enslaved household or a lack of interest in this component of the site. The

[^31]

Figure 7. Location of archaeological sites inhabited by enslaved Shenandoahans. Map by author.
past decade has seen a growing interest in the archaeology of enslaved life in the Valley, with six new sites being excavated (Figure 7). In the southern Valley there have been limited excavations at a farm associated with Liberty Hall (Gaylord 2016; 2018a; 2018b; Schweickart 2019) and a quartering site at Buffalo Forge, a 19 $^{\text {th }}$-century iron foundry (Schwartz 2016; 2017; 2018a; 2018b; Forthcoming). Limited excavations have occurred at the White House, a $19^{\text {th }}$-century farmstead in Page County owned by an enslaver (Carole Nash, pers. comm.), although structures definitively associated with enslaved people have not been identified yet. In the northern Valley, mitigation-related excavations have occurred at Clermont Farm in Clarke County (Geier and Nash 2016) and the Stickley Quarter in Frederick County (Cosby 2014; Cosby et al. 2013; Samulski 2014). The final site is the main quarter associated with Belle Grove Plantation, which is a large, unplowed site covering around 1.5 acres inhabited from c. 1800 into the 1850 s, with five possible house sites and four large sheet middens. Because of its size and decades-long
inhabitation, I selected this quarter to use for my dissertation, and I directed excavations at Belle Grove in 2015-2019 to get data for Assembling Enslaved Lives. This chapter provides a history of Belle Grove Plantation and the archaeological research that has occurred there.

## Belle Grove Plantation: A History

The portion of southern Frederick County that would become Belle Grove (Figure 8) was first inhabited by Virginia Indians. ${ }^{38}$ We do not know when Indigenous women and men came to this land, but one Paleoindian site (44WR455) has been found nearby, suggesting that Native people hunted on, camped at, and moved through Belle Grove as far back as 12,000 years ago. The most intensive evidence for the presence of Virginia Indians at and around Belle Grove comes from the Late Woodland era. A palisaded village site is located south of the plantation on the southern bank of the Shenandoah River (44SH001), and Woodland-era sites have been found at Belle Grove (including Quarter Site B) where women and men from this village likely gathered plants, hunted, and collected stones for making tools (e.g., Greer 2016a, 3; Forthcoming). However, social, political, and epidemiological shockwaves from European colonization east of the Blue Ridge Mountains severely disrupted Indigenous life in the Valley, and most local groups left the region by the early-18 ${ }^{\text {th }}$ century (e.g., McConnell 2010).

In 1731, the colony of Virginia granted Jost Hite and Alexander Ross 130,000 acres of land between the Potomac River and Cedar Creek, with the condition that they settle one family for every 1,000 acres they acquired (Hofstra 1990, 108; 2004, 34; Mitchell 1977, 29) (see Chapter 1). The heads of two of these families, James Hoge and William Vance, acquired land near the confluence of Meadow Brook and Cedar Creek in what would become southern

[^32]

Figure 8. Location of Belle Grove. Map by Erica Moses.

Frederick County. In 1748 Hoge sold 300 acres of this land to Jost Hite's son Isaac Hite, Sr. who bought an additional 183 acres from Vance in 1770 (Geier 1995, 8-9). These 483 acres became the core of Belle Grove Plantation. Hite did not live at Belle Grove, instead residing at his 1,689acre Long Meadow estate immediately to the south. The dividing line between these properties was the Great Wagon Road (modern Route 11). At some point before 1783, a two-story wooden dwelling, later known as Old Hall, was built at Belle Grove, along with a few possible outbuildings (Geier 1995, 10-11). Nothing else is known about the activities that took place at Belle Grove before 1783.

In 1783, Isaac Hite, Sr. granted Belle Grove to his son Isaac Hite, Jr. as a wedding gift following his marriage to Nelly Madison. The newly married couple took up residence in Old

Hall. In preparation for the Hite's arrival, a one-story addition was built onto the north (rear) façade of Old Hall, likely constructed of limestone (Geier 1995, 11-12). Following the wedding, Nelly Madison Hite's father, James Madison, Sr., gave the couple 15 enslaved people (Jemmy, Jerry, Milly, Sally, Eliza and her children Joanna, Dianna, Demas, Pinder, and Webster, and Truelove and her children Peggy, Priscilla, Henry, and Katey) who were forcibly relocated to Belle Grove (Chambers 2005, 241). By 1785, the Hites enslaved at least two other men (Ned and Primus) (I. Hite 1785), and in 1787 they paid taxes on 23 enslaved people (Schreiner-Yantis and Love 1987, 512). At least 64 other enslaved people lived within a few miles of Belle Grove in 1787 (Schreiner-Yantis and Love 1987), allowing an enslaved community to develop in the neighborhood (sensu Kaye 2007). In addition to 22 enslaved children born between 1788 and 1800, the Hites acquired 15 enslaved people from family members - a woman from Isaac Hite's sister in 1789, four from a cousin in 1791, and nine from Isaac Hite, Sr. upon his death in 1795 bringing the number of people the family enslaved to over 50 (I. Hite 1859).

By 1786, enslaved farmers grew a variety of crops in Belle Grove's fields, including "wheat, rye, oats, clover, flax, hemp, and buckwheat" (Geier 1995, 18; I. Hite 1785). To process the grains grown by enslaved farmers the Hites commissioned the construction of a large agroindustrial complex in the 1790s that included a storehouse, distillery, and gristmill, as well as a sawmill (Geier and Lotts 2003a). These agricultural activities are discussed in depth in Chapter 5. Over time, the Hites became increasingly involved in the cattle trade, buying underweight cattle from drovers making their way to Winchester and having enslaved cowherds fatten these animals in feeding lots over the winter before selling them (sometimes at twice their original value) the following year (Skinner 1821; also see McMaster 1990, 199; Sorrells 2005). While most people enslaved by the Hites worked in the fields or processed agricultural products, others
performed artisanal labor. This included enslaved carpenters, cobblers, blacksmiths, and probably coopers who made barrels for storing and transporting flour and whiskey (I. Hite 1794; Rockwell 1974, 84). Other enslaved people performed domestic labor like cooking and gardening to maintain the Hites' extravagant lifestyle.

As enslaved farmers enriched the Hites, the couple commissioned new outbuildings, a one-story limestone office and store approximately $750^{\prime}$ south of Old Hall, and a one-and-a-half story, $74^{\prime} \times 40^{\prime}$ limestone manor house, commissioned in 1794 and finished in 1797 (Geier 1995, 12-13). The layout of these buildings and the rest of the plantation landscape are discussed in Chapter 10. In the 1810s the Hites commissioned an addition off the west façade of the manor house, giving it a total length of $100^{\prime}$ and an icehouse was constructed $70^{\prime}$ south of Old Hall (Geier 1995, 19). Old Hall continued to be used as a dwelling, housing Isaac Hite's eldest daughter and her husband from 1811 to 1819. Oral history suggests that enslaved people may have lived in the dwelling afterward (Wootton et al. 1996, 13).

During this time, the Hites amassed thousands of acres in Frederick County (Figure 9). Wills and deed books (Buck 2007a; 2007b; 2007c; 2007d; 2008; 2009; 2010), provide a rough history of these acquisitions (Appendix C, Table 1). While the Hites began expanding Belle Grove in the 1790 s, most of their acquisitions during this decade occurred at two new properties. The first was Long Meadow, with the Hites inheriting most of the estate after Isaac Hite, Sr.'s death in 1795. While Long Meadow abutted Belle Grove, it was managed as a separate estate for the next four decades. Around this time the Hites purchased 400 acres along Buffalo Marsh (three miles north of Belle Grove's manor house). While this land was separated from the rest of the Hites' holdings, they bought another 595 acres in the area in 1799 and consolidated these into a 1,472-acre estate referred to as Rockville after buying an additional 477 acres in 1811.

Figure 9. Land owned by Isaac and Ann Hite, by tract. Cedar Creek land is part of Belle Grove, Rockville, or noncontiguous land between these estates. Data presented in Appendix C, Table 1.

Between 1799 and 1812 the Hites acquired 749 acres along Cedar Creek that were either part of Belle Grove or Rockville or noncontiguous with the rest of their holdings. Regardless, by the early 1810s, the Hites owned a (nearly) contiguous 4.5-mile stretch of Cedar Creek's eastern bank. The Hites also acquired land in eastern Frederick County (modern-day Clark County) near White Post (11 miles northeast of Belle Grove's manor house), buying 953 acres in 1805-1806, and expanding this into a larger, 1,100-acre estate referred to as Guildford in 1811. In 1823, the Hites gave Guilford to their eldest son, James Hite.

The Hites hired overseers to manage Long Meadow. Isaac Hite notes in an 1817 letter to Isaac Bowman that "in the summer and fall of 1813 my overseer Dabill informed me that he had repeatedly told you your fence was so defective that cattle, horses, and hogs were frequently depredating upon me" and that "My other overseers McMullin and Finnell have been equally clamorous" (I. Hite 1817a, my emphasis). In another letter, Hite writes "I can prove by every overseer that has lived with me since we agreed to join fences that your fence has been kept in
such repair that stock of every description... have depredated upon me every summer for at least six years" and "last summer my overseer rode over to your house and informed your wife that your cattle were on my oats" (I. Hite 1817b, my emphasis). In 1806 the Hites gave 22 acres of Long Meadow to Bowman (Buck 2007c, 39), and this was the only place where their properties abutted, placing the overseers at Long Meadow, where they could see the damage firsthand and report it to the Hites. Oral history also identifies a two-story dwelling at Long Meadow as the Hite-era "Overseer's House" (GeeGee Pasquet, pers. comm., 2018). The practice of employing overseers at Long Meadow continued until 1837, when overseer John Tipton was paid an annual salary of $\$ 101.17$ (Bent 1837). We do not have evidence of overseers at Rockville or Guilford, but since the Hites hired overseers for Long Meadow they likely employed at their other properties. The Hites' sons James, Isaac Fontaine, and Walker Hite may have also managed these estates at some point. Alternatively, it is possible that enslaved men managed these other properties (Sandy and Phillips 2021).

In the early- $19^{\text {th }}$ century, the number of people the Hites enslaved increased through inheritance, purchases, and enslaved mothers giving birth. By 1810, the Hites enslaved 103 women, children, and men (US Bureau of the Census 1810a). Ten years later they enslaved 101 people (US Bureau of the Census 1820a). The Hites would have divided these women, children, and men between their four plantations, and each would have had its own quartering site(s). ${ }^{39}$ As Belle Grove was the Hite's main plantation, making it the site of intense domestic labor in addition to agricultural and artisanal labor, I assume around 30 to 40 women, children, and men were enslaved at the property, but ultimately, we do not know how many people were enslaved

[^33]here. On 26 October 1824, the Hites sold "sixty slaves, of various ages" (Daily National Intelligencer 1824). While the specific reason for this sale is currently unknown, the Hites also advertised the sale of "a large number of Horses and Cattle" and "a great variety of Plantation Implements," including "Wagons, Carts, [and] Ploughs" so the couple may have decided to pay debts incurred during the Panic of 1819 by selling people into the interstate slave trade (see Chapter 5). By 1830 the Hites enslaved 55 women, children, and men.

Isaac Hite passed away in 1836. His will divided Long Meadow and Rockville among his children and bequeathed Belle Grove to his second wife Ann Hite along with the 44 people the couple enslaved (I. Hite 1827; US Bureau of the Census 1830a). While Belle Grove flourished under Ann Hite's ownership, she sold portions of the plantation and the number of enslaved people continued to decrease, with 26 people enslaved at the property in 1850 (US Bureau of the Census 1850d). The following year Ann Hite passed away. The remainder of the 1850s at Belle Grove remains unclear, although archaeological evidence suggests that enslaved people lived at the plantation after 1851 (see below). The Hites' son Isaac Fontaine Hite may have sent some of the 20 people he enslaved to Belle Grove to work the plantation's fields during this time (US Bureau of the Census 1850d).

In 1860, Benjamin and John Cooley purchased Belle Grove (Geier 1995, 22). That year the Cooleys enslaved six people: a 15-year-old boy, a 32-year-old mother named Harriet Robinson, and Harriet's four children (aged two to nine) (US Bureau of the Census 1860c). The Cooleys also employed Harriet's husband Lewis Robinson, a 57-year-old free Black farm laborer, and two free Black teenagers (Commonwealth's Witnesses 1861, 8; US Bureau of the Census 1860a). We do not know where all of these people lived, but the Lewis family resided in "an out house [sic] about 65 or 70 feet from [the manor] house" (Commonwealth's Witnesses

1861, 36). At approximately $60^{\prime}$ from the manor house, Old Hall is the most likely candidate, especially given the oral history about enslaved people living in the dwelling (see above). On 26 February 1861, Benjamin Cooley's wife Hetty was found severely injured in Bell Grove's smokehouse, later dying of her injuries. Harriet Robinson was charged with murdering Cooley, allegedly beating her and dragging her to the smokehouse. According to witness testimonies, Robinson "was a great enemy of Mrs. Cooley and... wished her dead many a time" (Commonwealth's Witnesses 1861, 5). A week before the alleged assault, Cooley beat Robinson's son Nath. When Robinson confronted Cooley about this, she "raised" a cane "to strike Harriet." Robinson, however, grabbed it and beat Cooley until a bystander separated them (Commonwealth's Witnesses 1861, 1-2, 35). The jury found Robinson guilty, and she was jailed in Richmond, Virginia before being executed in Staunton (Augusta County) in May 1862 (The Daily Dispatch 1862).

During the Civil War (1861-1865), United States (U.S.) and Confederate forces routinely occupied Belle Grove. This, however, did not completely impede life at the property. In 1863, the Cooleys bought two people from Rebecca Hite. At some point after his wife's conviction, Lewis Robinson left Belle Grove, and by 1864 the Cooley's replaced him with an unnamed free Black man who lived with his 27-year-old daughter and four younger children "right at the yard in a two-story log cabin," which might be Old Hall (C. Johnson 1915b, 392). In late October 1864, the U.S. Army was camped on the eastern banks of Cedar Creek, with Belle Grove serving as their headquarters (Geier 1995:24). On 19 October the Confederate Army attacked the U.S. camp in the Battle of Cedar Creek, which the U.S. won after over 12 hours of intense fighting.

Following the Civil War, the Cooleys sold Belle Grove to James Davidson, who in turn sold the estate to John Rose, who sold the property again to James Smellie in 1881 (Geier 1995,

29; Rockwell 1974, 9). Andrew Brumback bought Belle Grove from Smellie in 1907, and his son J. Herbert Brumback inherited the property in 1912 (Geier 1995, 30). Under the Brumback's ownership, Belle Grove underwent the largest transformation in a century, with many remaining Hite-era outbuildings demolished to create a modern farm complex (Geier 1995, 31). The Brumbacks operated a bed and breakfast at the property in the 1920s, using the food they produced to feed guests (Geier 1995, 32). One frequent guest of Belle Grove during the 1920s was Frances Hunnewell, who bought Belle Grove from the Brumbacks in 1929 and restored the manor house to its Hite-era appearance (Geier 1995, 32).

Following Hunnewell's death in 1964, Belle Grove was bequeathed to the National Trust for Historic Preservation (NTPH). Three years later the property became a historic house museum operated by Belle Grove, Inc., which strives to maintain the property's historic integrity to "stimulate historical and preservation awareness" (Belle Grove, Inc. 2019). Outside of the plantation core, much of Belle Grove is wooded or rented by local farmers. In 2002, the National Park Service established the Cedar Creek and Belle Grove National Historical Park, which officially opened in 2010, which operates in partnership with NTPH/Belle Grove, Inc. and several other organizations.

## Archaeological Research at Belle Grove

Archaeological research at Belle Grove began in 1972 and has continued periodically through 2021 (Geier and Tinkham 2006a; 2006b). Excavations in 1972-1994 focused on the manor house grounds (44FK016), including a shovel test pit (STP) survey of the site and excavations of Old Hall and several outbuildings (Geier 1994; 1995; Geier et al. 2008; Paonessa 1995; Rockwell 1974; Verry 1984). From 1994 onward, excavations continued periodically at the manor house (Geier and Tinkham 2007; Greer 2022), but research at Belle Grove began to
shift to the broader plantation landscape. Surveys and excavations have occurred at a cabin inhabited by white employees listed in tax and census records (44FK522), the office and store (44FK502), the agro-industrial complex, and fields and woods south and west of the manor house (e.g., Geier and Lotts 2003a; 2003b; Geier et al. 2006; Geier and Whitehorne 1994; Geier and Zienty 2001; Greer 2021).

Among the sites that have been identified are a possible quartering site (44FK520) - now called Quarter Site B - and an agricultural complex (44FK521), both located in a field just west of the manor house grounds (Geier 1995; Geier and Whitehorne 1994). ${ }^{40}$ These two sites were located through a limited STP survey in 1994-1995, but their boundaries had not been delineated. In 2015-2018 I led archaeological investigations at these sites to determine their boundaries, assess their archaeological potential, and identify areas of interest that could be targeted in subsequent excavations (Greer 2016a; Forthcoming). This work began with the excavation of 444 STPs throughout the field west of the manor house on a 40 ' grid, which was then filled in with a $20^{\prime}$ grid in portions of the field determined to be part of the two sites to better assess artifact distributions (Figure 10). In 2018-2019 we added 24 additional STPs (468 total) to extend the boundaries of the initial survey. The STPs identified the boundaries of the two sites, which abut one another, and located artifact concentrations at Quarter Site B. In 2016 and 2019 we excavated 13 3' x 3 ' test units at the quartering site and one test unit at the agricultural complex to assess areas of interest from the STP survey and to determine the sites' integrity. Artifact concentrations proved elusive at the agricultural complex, with a light nail scatter found throughout the site. This type of distribution is not uncommon when dealing with agricultural buildings and in these cases, metal detector surveys are often better at locating structures than

[^34]

Figure 10. Shovel test pit survey at Quarter Site B, 2015-2016. Map by Erica Moses.

STPs (e.g., Reeves 2015b), so I worked with the Archeological Society of Virginia to conduct a metal detector survey of the site in 2018.

The metal detector survey excavated 666 detector hits at the site, generally located in four concentrations, suggesting the presence of two sheds in the southern end of the site, and a large barn and stable in the northern end. This was further confirmed by the presence of two buildings in the location of the stable and barn on Civil-War era maps of the property, and late- $19^{\text {th }}$ century photographs of the structures (Figure 11). No further work has been conducted on these

Figure 11. Historical documents depicting the agricultural complex (44FK521). Top: Sketch of the Battle of Belle Grove or Cedar Creek" by Jedidiah Hotchkiss, 1864. Image courtesy of Library of Congress. Agricultural Complex is represented by the two squares left of the road in the center of the map. Bottom: Photo 11.9, by Thomas D. Biscoe, 30 July 1884. Image courtesy of Marietta College. The stable and barn are the two buildings on the left.
buildings, and a ground-penetrating radar survey and test excavations are needed to identify their exact location, size, and orientation.

The initial investigations at Quarter Site B determined it to be a large (approximately 1.5 acre) quartering site. While soils at the site are moderately deflated from erosion, they had never been plowed, indicating a high degree of stratigraphic integrity. Ceramics from the site are primarily pearlware and whiteware, with relatively few earlier vessels, indicating that it did not have an extensive $18^{\text {th }}$-century occupation. We recovered multiple double-struck cut nails from the site, which date to 1790-1810 (G. L. Miller et al. 2000, 14). These nails are commonly found

Figure 12. Belle Grove house across Middle Brook, by James E. Taylor. The three houses on the left are in the location of Quarter Site B. Image from Taylor (1989, 401).
at the manor house grounds, indicating that they were used in the 1790s construction of the manor house (Geier 1995). The presence of these nails at Quarter Site B suggests that it was constructed around 1800, (partially) using leftover nails from the manor house construction. Blue-tinted ironstone sherds have been recovered from the site, indicating that it was inhabited into the 1850s (T. Majewski and O’Brien 1987, 122; G. L. Miller 1980, 18). Enslaved people may have lived at the quarter in the 1860 s, but the (relatively) small number of people the Cooleys enslaved and the evidence for enslaved people living in Old Hall suggests that Quarter Site B may have been abandoned at this time. While the quarter does not appear on Civil Warera maps, an 1880s sketch of the battle shows three houses in the vicinity of Quarter Site B (Figure 12).

The STPs located four large sheet middens and five possible house sites within the quarter (identified by discrete clusters of architectural artifacts), indicating a large number of people lived at Quarter Site B. This strongly indicates that the site is an enslaved quartering site, as census records do not show the presence of a large free white community at Belle Grove. Furthermore, the one house we excavated (see below) had a subfloor pit, and this type of feature is predominately associated with the homes of Black Virginians, who used them for storing food and personal items (Samford 2007). The large number of people that would have lived at Quarter

Site B further suggests that it was Belle Grove's main quartering site, likely inhabited by farmers, artisans, and domestic laborers working in the manor house.

In 2017-2019 my team and I excavated 103 units at Quarter Site B, focusing on the easternmost house site (House Site 1), the yard spaces surrounding it, and three large middens near the home (Middens 1, 2, and 3) (Figure 13). ${ }^{41}$ To sample the middens, we randomly placed 10 3' x 3' units in Midden 1, three in Midden 2, and three in Midden 3, with the number of units determined by the relative size of the middens. An additional two $3^{\prime} \mathrm{x} 3$ ' units were excavated in Midden 2 to explore an artifact concentration identified in unit QB046, two additional $1.5^{\prime} \times 1.5^{\prime}$ units were excavated in Midden 1 to delineate and excavate postholes identified in units QB058 and QB059, and an additional 3' x 3' unit was excavated in Midden 1 to delineate an indeterminate trench feature identified in unit QB055. We excavated 40 units in a 12' grid of 3' x 3' units throughout the rest of the project area to locate potential structures and collect data to assess the possibility of a swept yard in this part of the site. Potential features in four of these units necessitated excavating adjacent $3^{\prime} \mathrm{x} 3^{\prime}$ units, including what was thought to be a potential foundation off QB052 (this ended up being a bedrock outcropping), a posthole in QB048, linear striations that ended up being bioturbation in QB013, and a borrow pit in QB033. Additionally, two units had features that required excavation blocks. One block, composed of eight $3^{\prime} \times 3$, units and one 3 ' x 1.5 ' unit, delineated a series of fire pits and assessed artifact distributions around these features. The fire pits are discussed in Chapter 10 along with the distribution of artifacts throughout the project area.

We established the second excavation block, composed of 29 3' x 3' units, based on the presence of burned architectural debris in QB011, which ended up being the location of a $\log$

[^35]

Figure 13. Units excavated at Quarter Site B, 2017-2018.
cabin that was likely built by enslaved people around 1800 when Quarter Site B was constructed, and which burned down in the 1850s while enslaved people were still living at the dwelling. We established that this was a cabin through the recovery of 11.45 kg of daub used to chink the gaps between the dwelling's logs. We did not excavate the entirety of the cabin's footprint, but we did excavate a continuous $39^{\prime}$ stretch of units running north-south through the block without encountering foundation elements, indicating that the cabin lacked a foundation. Instead, it likely rested on brick or limestone piers or sat directly on the ground surface. We did, however, recover 119.43 kg of brick fragments and 2.21 kg of mortar, likely from a brick chimney attached to the dwelling. This chimney is the subject of Chapter 10. We established the construction date for the

Figure 14. Cellar excavations, August 2018. Photo by Erica G. Moses
cabin based on the presence of double-struck cut nails from the house debris and the date of the fire based on the recovery of blue-tinted ironstone from the demolition debris (see above). A large quantity of household goods were recovered from the debris, including ceramics, glass bottles, decorated tobacco pipes, and an intact pocket knife, indicating that the house burned while inhabited. We also recovered four Civil War-era bullets from this block, all from deposits overlying or within the first $0.1^{\prime}$ of the burned debris, further indicating that the house was destroyed before 1864. In the interior of the cabin, we identified and excavated two large cellar features (Figure 14). The first (Feature 3) is a large (12' x $7^{\prime}$ ), shallow ( $<2^{\prime}$ deep) root cellar used until the late 1830s when it was filled in and a smaller ( $7^{\prime} \times 5^{\prime}$ ) subfloor pit was excavated out of
the cellar fill (see Chapter 7 for further discussion). The house's residents used the subfloor pit until the dwelling burned, indicated by copious amounts of burnt debris from the feature fill.

In total, the 2015-2019 fieldwork recovered 60,285 artifacts, 59,177 of which came from Quarter Site B (Appendix C, Table 2). Half (49.24\%) of the quarter artifacts are architectural, including 13,225 brick fragments, 6,643 daub fragments, 2,530 shards of window glass, and 5,211 nails and nail fragments. The architectural artifacts are discussed in Chapter 10. The next largest artifact category is ceramics at $18.01 \%$ of the collection. These are discussed at length in Chapters 7-9. Faunal remains make up the next major group of artifacts at $16.72 \%$. These include animal bones (8,345 fragments), marine shells (1,148 fragments), and eggshells (407 fragments). Scott Oliver analyzed animal bones from Quarter Site B (Oliver Forth.) and Katelyn Bajorek (In Press) analyzed the eggshell. During the excavations, we collected at least 2 liters of soil from every deposit for flotation, including 285.75 liters from the root cellar and subfloor pit. We also collected all ethnobotanical materials larger than 1cm during the excavations. Linda Seminario is analyzing ethnobotanical remains from the cellars for her M.A. thesis at the University of Massachusetts, Boston (Seminario Forth.). The food remains are discussed in Chapter 6. The remaining $16 \%$ of the collection includes a variety of household, personal, and work-related artifacts, ranging from glass bottles and chimney lamps to buttons, beads, awl blades, and straight pins.

With its large size, extensive artifact collections, and decades-long inhabitation, Quarter Site B is an excellent source of archaeological data on enslaved life on rural farms and plantations in the northern Shenandoah Valley. But it must be noted that it is different than most quartering sites in the region. Most enslaved Shenandoahans were enslaved with fewer than nine other Black Virginians. As a result, most Valley quarters had one, possibly two, dwelling(s) (see

Chapter 1). The Hites, by contrast, were one of the largest enslaving families in the Valley and our data suggest five possible house sites at Quarter Site B, making it one of the largest quarters excavated to date in the region. One could argue that this makes Quarter Site B a poor choice for this study, but three factors negate this. First, because Quarter Site B is larger, it provides data on more households, which provides more insight into enslaved lives in the Valley than I would get from a site with only one dwelling. Second, Quarter Site B is the longest inhabited quartering site excavated to date in the Valley, with enslaved people living there from around 1800 into the 1850s, making it the best site for assessing how enslaved people's lives changed over time. Third, except for the chapter on landscapes at Belle Grove (Chapter 10), the themes I address in Assembling Enslaved Lives - agricultural labor, hunger, restrictions on consumption practices, and how enslaved people used ceramic vessels - should not be affected by my focus on one of the larger excavated quarters in the Valley. However, no one study can adequately speak to enslaved life in a region, and additional studies will be needed to provide a more textured look at enslaved life in the Valley.

Chapter 5 (Grain) uses archival documents from Belle Grove, other estates in Frederick County, and local newspapers to study how grain affected the lives of enslaved farmers, and how these women and men affected the Valley's political economies. Archaeological materials from Quarter Site B, specifically faunal and ethnobotanical remains are first used in Chapter 6 (Hunger), where they are juxtaposed against written records to discuss enslaved foodways and the ontological politics of hunger waged over what constituted an adequate diet for Black women, children, and men. Chapter 7 (Cities, Towns, and Country Stores) uses ceramic vessels from Quarter Site B and ledgers from Valley stores to assess how local laws/practices affected enslaved people's ability to travel to cities, towns, and county stores to buy and sell commodities.

This focus on ceramics continues in Chapters 8 (Imported Tea and Tablewares) and 9 (LocallyMade Utilitarian Ceramics), which look at the ways enslaved people used tea, table, and utilitarian wares to make lives for themselves and teases out some of the ways they affected the local economy. Finally, Chapter 10 considers architecture and artifact distributions at Quarter Site B to discuss the role the landscape played in the ontological politics of enslaved life at Belle Grove.

Before continuing, I would like to make a note on community involvement in the archaeological research. Unfortunately, at the outset of this project, Belle Grove had not been able to identify descendants of the women and men enslaved by the Hites, and many Black Shenandoahans were understandably hesitant to work with institutions like Belle Grove given the way enslaved life has been treated in the Valley. As a result, I was not able to consult with community groups when starting my research. However, in the past seven years Belle Grove has done genealogical research to find and reach out to descendants and worked to build connections with Black Shenandoahans. As part of this, I have presented as much of my research as possible to Black history groups in the region, both to ensure that they know about the ongoing archaeological research and so I could their opinions on how I was interpreting my data. Their feedback forced me to rethink some of my approaches and pushed me to do more research on topics they found especially interesting. This is not an ideal way to do a community-engaged project (e.g., Reeves 2022; Westmont and Clay 2022), but it did provide Black Shenandoahans with some amount of control over the archaeological research. Perhaps more importantly, these outreach activities have created an environment where community groups can be involved in any future work at Belle Grove, and I intend to consult with them when planning additional work on enslaved life at the plantation.

## Chapter 5: Grain

My [enslaved] father was [a] farmer for years, and raised some of the finest crops of wheat I ever saw. He was considered one of the best farmers in [Frederick] county. (Adams 1872, 11)

Forced labor took up much of enslaved farmers' time, with the ins and outs of various cash crops shaping what they did throughout the year (e.g., Galle 2011; P. D. Morgan 1998; Pargas 2010). In the Shenandoah Valley, the main cash crops were grains, primarily wheat, but also rye, corn, and oats. If we want to understand the lives of enslaved Shenandoahans, we need to start with the agricultural labor most of them performed. In this chapter, I will look at four ways grain agriculture shaped enslaved life in the Valley. First, I discuss the tasks associated with different grains and how they shaped enslaved farmers' yearly cycle. Second, I consider the important role enslaved women played in these tasks, and how forcing enslaved women to do fieldwork served as a way for enslavers to define them as differently and enslaveably human. Third, I assess enslaved farmers' contributions to agro-capitalism in the Valley and how their labor allowed the region to flourish. Finally, I turn to grain markets to look at how the rise and fall of flour prices map onto enslavers' decisions about when to hire or sell enslaved women, children, and men - choices that profoundly affected enslaved life. These provide an understanding of what enslaved farmers did and how their actions affected the Shenandoah Valley. They also set us up to talk about how hunger affected enslaved people and what time of year they were more likely to go to, and acquire things from, market towns - topics I will explore in Chapters 6 and 7.

In this chapter, I refer to the women and men who did the work of farming as farmers, instead of farmhands or farm laborers. I do this in part because in this chapter's epithet, John Adams refers to his enslaved father as a farmer. If he understood his father to be a farmer, then I
want to use that language as well. I also do this in part because farming was, and is, skilled labor, and refer to the people who did it as laborers or hands downplays this skill and the incredible knowledge enslaved farmers acquired over years of working in the field. It was their skill and knowledge, as much as their labor, that allowed the Valley to prosper in the $19^{\text {th }}$ century

## Plow, Plant, Harvest... Plow, Plant, Harvest

$21^{\text {st }}$ June - Commenced cutting my harvest wheat.... July $9^{\text {th }}$ Friday, Finished cutting my harvest. (F. B. Jones 1860, 26)

Farming is monotonous. It involves doing the same task over and over again for days or even weeks at a time. And these tasks usually take place at the same time each year, plowing yet another furrow in yet another field, a cycle that will repeat next year, and the year after that. Like all assemblages, these actions do not repeat in the exact same way. Drought, heavy rains, or infestations could profoundly affect what enslaved farmers did, just as the contours of individual fields made working in each of them a unique experience. But when we look at how these tasks repeated from year to year, we see the months in which enslaved farmers did certain tasks remaining fairly consistent, creating a fairly taught set of assemblages. To see this, I turn to letters written by the Hites and other Valley enslavers, and the journal of Francis Jones (1860). Jones enslaved 11-12 people at Carysbrook, a farm located between Newtown and Winchester, and kept a journal detailing the tasks enslaved farmers did throughout the year. Unfortunately, Jones did not keep consistent records, frequently omitting entire months and even whole seasons, and his handwriting leaves much to be desired. However, 389 individual tasks performed by enslaved people from 1850-1860 could be transcribed, 334 of which pertained to agricultural labor and 253 dealt directly with grain (Appendix D, Table 1).

The primary wheat variety grown in the Shenandoah Valley was soft red winter wheat (Rood 2014, 25). This variety grows well in warmer weather and is less prone to spoilage when
stored in humid climates. Winter wheat gets planted in the fall and harvested in late spring or early summer, a cycle that works well in the Valley as spring rains are common and summer rains are rare. ${ }^{42}$ Jones indicates that enslaved people sowed wheat between mid-September and mid-October. This process involved spreading seed wheat in fields before using a harrow (a shallow plow) to plow it into the ground (I. Hite 1803). Before this can be done, the field must be prepared by plowing (I. Hite 1803). Jones frequently mentions enslaved farmers plowing fields between late August and late September, and this was likely done in preparation for sowing wheat. Once sown, winter wheat requires little attention before harvest, a time of frenzied activity that Jones indicates lasted for a few weeks between late June and mid-July (also see Burnet 1805; A. T. Hite 1827; 1840). In late July and early August, enslaved farmers hauled wheat out of fields, stacked straw, and threshed wheat (separating wheat kernels from the rest of the plant) either by hand or using a mechanical thresher (also see I. Hite 1821; George Wright 1821). Although Jones does not mention it, enslaved waggoners typically brought threshed wheat to mills in the fall and winter (Spring Mill 1830).

Rye has a similar annual cycle to winter wheat, and at times Jones mentions enslaved farmers working in wheat and rye fields on the same day. Rye fields were plowed in September and sown with seed rye throughout the fall. Jones' records indicate that rye sowing was a task that was frequently interrupted, with enslaved farmers stopping to do things like harvest corn for weeks at a time before sowing rye again. The rye harvest took place from late-June to mid-July alongside the wheat harvest. Although Jones does not mention it, enslaved farmers likely spent July and August hauling rye out of fields, stacking rye straw, and threshing the grain. Enslaved

[^36]waggoners primarily brought rye to mills between March and May, and August and October (Spring Mill 1830).

Oats had a different growing cycle than winter wheat or rye, shaping enslaved Shenandoahans' lives in different ways. A few fields at Carysbrook were plowed every year between late February and late March, and enslaved farmers sowed oats in some of these in late March. Like wheat and rye, oats seemingly required little attention between planting and harvest. In 1859 (the one year he mentioned it) Jones states that enslaved farmers harvested oats in late July. Enslaved farmers likely hauled oats out of fields for threshing and storage, and stacked oat straw in early August. Oats were primarily used as animal fodder, so enslaved farmers did not need to bring them to local mills for processing (Spring Mill 1830).

The other fields enslaved farmers plowed in the late winter were planted with corn in April and May. In early to mid-June, enslaved farmers ventured back into cornfields to thin them out and remove suckers (or side shoots) from cornstalks to improve the crop's productivity. Corn tends to be more drought-tolerant than wheat, so it was left to grow throughout the summer. However, particularly bad weather would still mean poor corn harvests, while particularly good weather could produce bumper crops (I. Hite 1799; 1805). Jones notes that enslaved farmers harvested corn between late September and early October. Unlike the other grains, however, Valley farmers could plant two corn crops per year, with fields for the second crop plowed in early to mid-June or in mid-July after the wheat harvest. Jones does not record when the second corn crop was planted, but this likely occurred not long after fields were plowed. Enslaved farmers harvested the second corn crop between early November and early December. After harvest, corn was hauled in and shucked by enslaved people in December and January.

Growing grains requires preparing and maintaining fields. To transform a plot of land into a field, enslaved farmers had to clear out all the plants already growing there. Frequently, this involved burning the area. If there were trees, they had to be cut down and their stumps grubbed (dug out). Enslaved farmers often had to do these same tasks to prepare fields that had not been used in a while. At Carysbrook, clearing fields mostly took place between February and April (right before sowing oats and corn), and again in August (right before sowing wheat and rye). Not every field was used every year. Some enslavers preferred letting fields lay fallow for four years before replanting (I. Hite 1803). Jones notes that enslaved farmers prepared fields to lay fallow in late July and late September, presumably after the wheat and first corn harvests were complete (respectively), although he does not note what this entailed. Many fields had timothy grass seed sewn into them while laying fallow, preventing soil erosion before wild grasses accumulated. This mostly took place between September and December after crops were harvested and fields prepared to lay fallow. By late spring, timothy could be turned into animal fodder by cutting it for hay. Jones only mentions cutting timothy once, in mid-June 1852, but this likely occurred throughout the summer whenever the grass grew tall enough and enslaved farmers had time to mow the fields.

Enslaved farmers also sowed clover seeds in fallow fields. Clover is a nitrogen-fixing plant and plowing grown clover into the soil was a common way of fertilizing fields. Enslaved farmers usually sowed clover seed between mid-February and early April, and occasionally cut hay from clover plants in late Spring. Other fertilizers, including plaster of Paris and manure, were also plowed into fields as fertilizers. Jones notes that this mostly took place in February, March, and April. White farmers mostly bought plaster from Edward Sperry's Middletown store
between November and February (Sperry 1839), further suggesting that "sowing plaster" was a winter/spring task.

Enslaved farmers at Belle Grove would have been especially familiar with these fertilizing techniques. While the Shenandoah Valley overall is well-suited for agriculture (e.g., Raitz 2010, 43-44), many upland portions of Belle Grove possess relatively unfertile Carbooaklet and Frederick-Poplimento soils, while bottomlands associated with Belle Grove's floodplains possess fertile Massannetta loam (Geier and Whitehorne 1994, 14). This difference did not escape the notice of enslaved farmers, or the Hites, as in 1821 the "river bottom part of Belle-Grove estate [which might be referring to Long Meadow or Rockville], was estimated to yield 6 barrels of corn per acre - the upland not more than four" (Skinner 1821). To increase soil fertility, the Hites had enslaved women and men use new methods of fertilization including manure, clover, gypsum, plaster of Paris, and burned limestone (Skinner 1821). Ultimately, the Hites concluded that planting upland fields once every five years and using them during the other four years as pasturage for Belle Grove's horses, cattle, and sheep worked the best (I. Hite 1803).

Grain agriculture took up much of enslaved farmers' time between February/March, when clearing and plowing corn/oat fields began, through October/November when the corn harvest was finished and fields were sown with rye and timothy (Table 2). While there was time for these women and men to do other agricultural tasks (gardening, mending fences, shearing sheep, etc.) between March and June, Jones rarely recorded other work being done between mid-June and November, suggesting that tasks like harvesting, plowing, and threshing took up most of their time. Unfortunately for enslaved farmers, the late fall and early winter months were still busy, as Jones and other enslavers had enslaved people butchering hogs, cutting wood, and

mending fences throughout the winter (Keller 2000). In other words, agricultural tasks kept enslaved Shenandoahans busy throughout the year. But, unlike white farmers who were
primarily men, the enslaved farmers in the Valley were both men and women, a division of labor used to define enslaved people as differently human.

## "In the Busy Seasons, Worked Occasionally on a Farm"

Her back and muscle were pressed into field labor where she was forced to work with men and work like men.
(Omolade 1983, 354)
Shenandoah Valley newspapers frequently printed descriptions of enslaved farmers. Thomas Burwell (1828) described Stephen, a farmer he enslaved, as "an excellent farm hand not surpassed as a stacker and seedsman," while Samuel Cameron (1831) called Simon, another farmer, "a first-rate farm hand." Other, unnamed men were described as "an able and skillful hand at every kind of farming business," "a good farmer, understands ploughing, cradling, mowing and wagoning," or, less flatteringly, "can throw a harvest cradle and cut grass, and can do any other kind of farming work as well as the common run of negroes" (Garnhart 1816; B. Taylor 1810; Winchester Gazette 1813). But while we tend to think about enslaved farmers as being distinct from enslaved artisans and domestic laborers, this was not the case in the Valley. Enslaved tradesmen like blacksmiths, carpenters, cobblers, and distillers worked as farmers for at least part of the year (T. Briscoe 1820; Burwell 1828; J. Downey 1810; Ranson 1814; Savage 1822). Sometimes they worked in their enslavers' fields and other times these men were hired out to other farmsteads (Simmons and Sorrells 2000). This is especially true for cobblers, who could work in the field between February and November and spend the winter making shoes (e.g., Farmers' Repository 1816a). Enslaved domestic laborers also worked in the fields, especially during the wheat and rye harvests (Banks 1861, 12; Daugherty 1841; Farmers' Repository 1810; 1813a; 1813b; 1818; Haines 1812; McCoy 1841). Ann Hite (1826), for instance, told her daughter that while she could send her "a man servant" to help with gardening
and other domestic tasks, "it [was] rather inconvenient to spare one before harvest," presumably because any man who could work in the fields would do so at that time. Therefore, the annual rhythm associated with growing grains shaped life for most enslaved men. But it also shaped life for many enslaved women.

Advertisements for the sale and hiring out of enslaved women in Valley newspapers indicate that most women did domestic/household labor. Of the 108 advertisements for enslaved women in the Farmers' Repository, Virginia Free Press \& Farmers' Repository, and the Virginia Free Press that list the skillsets of enslaved women, 107 mention domestic/household skills, with cooking and washing being the most commonly (Appendix D, Table 7). But these also demonstrate that enslaved women were farmers, and at times even described as "excellent" or "first rate" farmhands (W. Brown 1816; Cromwell 1841; E. Downey 1813; Farmers' Repository 1815; 1816b; J. Forman 1831; McCabe 1832; Saunders 1810). Other women bore scars on their "arms near the hand" from being "cut by a scythe" (Tallman 1793), marking them as farmers. Bethany Veney $(1889,19)$ described working in cornfields while enslaved in Page County, and Daniel Lockhart (B. Dew 1856, 45) mentions being in charge of enslaved women while serving as a driver/overseer in Frederick County. Enslaved women (Sally and Truelove) made up $40 \%$ of the enslaved workforce assigned to Benjamin Little, Belle Grove's overseer in 1786 (I. Hite 1785).

Some of these women certainly worked in the fields full-time. But, if the sale and hiring advertisements are any indication, many enslaved women in the Shenandoah Valley worked as farmers and domestic laborers, as all but one advertisement (E. Downey 1813) that lists the agricultural skills of enslaved women also state that they have experience doing housework. Some seem to have only worked in the fields "in the busy seasons" when grains were being

Figure 15. "Shenandoah Valley," by Russel Smith (1846). Image courtesy of the Johnson Collection.
planted and harvested (Farmers' Repository 1816b) - a time when everyone who could work in the fields seems to have been sent there. Catherine Sims $(1972,78)$ recalls working "in de house" as a cook and "on de farm" doing "eberthin' cept plow" while enslaved in Rockingham County. An unnamed Free Black woman employed at Belle Grove in 1864 (C. Johnson 1915b, 393) recalls:

I'd be cookin' at the big house, and the next week I'd be a field han'. The slave woman and I took turn about, you know. I used to drop the corn when the men were planting, and I'd help cuttin' up [corn], and when they had the horse-power th'ashing I'd take the sacks off and I'd put back the chaff. I would always help in harvestin' and such as that, and when they were extry busy at the big house I'd put in mo' time there makin' butter, perhaps, and washin' and doin' other work that needed doin'.

Local artwork also records enslaved women's agricultural labor. Russell Smith's 1846
painting "Shenandoah Valley" is a picturesque representation of a local farm, complete with four
enslaved people harvesting wheat (Figure 15). Three are depicted as men. But the fourth person is depicted as a woman wearing a skirt and an apron, thereby providing us with an image of women doing farm labor in the Valley.

Working in the fields was a common experience for enslaved women throughout the Americas (J. L. Morgan 2004; P. D. Morgan 1998; Pargas 2010). Some in the Valley worked in the field year in and year out, while others only did so "in the busy seasons." But agricultural labor was something most enslaved women did in the Valley. Some white women also worked in the fields, but the regularity of Black women's agricultural work, along with the ways their labor was commodified and exploited made their experiences fundamentally different than those of (most) white women (J. L. Morgan 2004, 145; Shammas 1985, 10-11). ${ }^{43}$ Instead, the embodied experiences of enslaved women working in the fields would have been closer to that of enslaved men. This fully comes into focus when the work done by enslaved women is compared to elite women - those most likely to be enslavers and those for whom local notions of white womanhood were explicitly made. These elite white women might manage agricultural labor, as Ann Hite seems to have done at Belle Grove after Isaac Hite Jr.'s death in 1836 (e.g., A. T. Hite 1840), but they did not work plows or swing scythes.

These differing labor expectations played into the ontological politics that rendered Black people, especially Black women, as differently and enslaveably human. In other words, elite white women were rendered fully human (or at least more fully human than Black women) because they only performed domestic and household chores; a way of being human that was only made possible by Black women's agricultural labor (which freed elite women from farm

[^37]work) and which emerged in and through the simultaneous definition of Black women as differently and enslaveably human because they could, and should, "work with men and work like men" to plant, harvest, and process grains (Hartman 2016, 168; J. L. Morgan 1997, 185; 2004, 145; Omolade 1983, 354). Enslaving assemblages decomposed enslaved women so their "back[s] and muscles" could be "pressed into field labor," a process of "un-gendering" wherein enslavers ceased to recognize what they had previously seen as discrete ontological categories of "male" and "female" among the enslaved, at least while they labored together in the fields (Hartman 2016, 168; Omolade 1983, 354; Spillers 1987, 66). As a result, these decomposed women could be reassembled with labor practices that allowed enslavers to accumulate ever greater profits from the agricultural work they did. This highlights the fact that when we talk about the ontological politics that rendered enslaved women as differently human we are not talking about women who happened to be enslaved (at least from their enslavers' perspective), but people defined as inhabiting an ontological category that enslavers understood as entirely distinct from that inhabited by white women (Hartman 1997; Spillers 1987). And yet, this does not mean that enslaved women who did fieldwork did not consider themselves to be women (also see LeFlouria 2015, 85). For instance, in her famous 1851 "Ain’t I a Woman" speech, Sojourner Truth $(1995,36)$ declared "Look at my arm! I have ploughed, and planted, and gathered into barns, and no man could head me! And a'n't I a woman?" Enslaved women in the Valley may have made making similar proclamations.

These ontological politics profoundly affected agro-capitalism in the Shenandoah Valley. Most white Shenandoahans were not farmers. White women did not do fieldwork year-round, and many did not work in the field at all, depending on their economic status. Many white men were artisans and professionals. In 1853-1859, only $59.43 \%$ of the 249 white men whose

Table 3. Estimated number of white and enslaved farmers in Frederick, Shenandoah, and Warren Counties, 1850. Percent farmer determined by the percentage of farmers and laborers listed in county death records, 1853-1859 (see Appendix B, Tables Table 4. 1-3). White men, enslaved men, and enslaved women are the total number of each group listed as aged 15 or older in the 1850 Federal Census. Census data from IPUMS National Historical Geographical Information System (Manson et al. 2020). Estimated white farmers calculated by multiplying the number of white men per county by percent farmer. Estimated enslaved farmers calculated by multiplying the number of enslaved adults by $80 \%$.

| County | Percent <br> Farmer | White <br> Men | Enslaved <br> Men | Enslaved <br> Women | Estimated White <br> Farmers | Estimated <br> Enslaved Farmers | Estimated Percentage <br> Farmers Enslaved |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Frederick | $69.83 \%$ | 3725 | 637 | 644 | 2601 | 1025 | $28.26 \%$ |
| Shenandoah | $54.88 \%$ | 3582 | 316 | 241 | 1966 | 446 | $18.48 \%$ |
| Warren | $42.85 \%$ | 1379 | 462 | 456 | 591 | 734 | $55.41 \%$ |

occupation is listed in the Frederick, Shenandoah, and Warren County death registries are listed as farmers (Buck 1996; 1997a; 1997b) (Appendix B, Table 1). If we can take the death registry numbers as an accurate portrayal of the percentage of white agricultural workers in the three counties, we can use population data in the Federal Census to estimate that 5,162 white men worked as farmers in 1850 (US Bureau of the Census 1850a; 1850b; 1850g) (Table 3). ${ }^{44}$ By contrast, most enslaved adults worked in the fields, at least in the busy seasons. We will never know exactly how many enslaved adults worked in the Shenandoah Valley's wheat fields, but it seems safe to assume that at least $80 \%$ of enslaved adults did so. Since 2,756 enslaved adults are listed in the 1850 Slave Schedule for Frederick, Shenandoah, and Warren Counties (US Bureau of the Census 1850c; 1850d; 1850f), we can estimate that at least 2,205 of them did agricultural labor. If our rough estimates are at all reliable, this would suggest that enslaved people made up

[^38]about $30 \%$ of the agricultural workforce in Frederick, Shenandoah, and Warren Counties in 1850. On a per county basis, $28.26 \%$ of the agricultural laborers in Frederick County, $18.48 \%$ of those in Shenandoah County, and $55.41 \%$ of those in Warren County may have been enslaved, while enslaved people only made up $8 \%, 4 \%$, and $14 \%$ of these counties populations (respectively). It is also worth pointing out that larger percentages of Frederick, Shenandoah, and Warren Counties were enslaved between 1810 and 1840 than in 1850, so a larger percentage of the agricultural workforce would have been enslaved before 1850 .

I want to stress that these are very rough estimates, but they are worth considering because they suggest that enslaved people had a larger impact on the Shenandoah Valley's grain production than previously recognized because enslaved people were more likely to work in the fields than white people. And a sizeable portion of this contribution would have come from enslaved women, who "in the busy season, worked" in the Valley's grain fields. Another way to assess this impact is looking at local mill ledgers.

## Profitable Labor

I earned money, but nebber got it.
(Sims 1972, 79)
Enslavers sold most of the grain enslaved farmers harvested. There were three main ways they did this. If they owned a mill and had contacts with merchants in Alexandria (Virginia), Baltimore (Maryland), or Georgetown (Washington D.C.) enslavers could have their grain milled and shipped east without going through middlemen in the Shenandoah Valley. This was largely reserved for the wealthiest enslavers, as they were more likely to own mills, have contacts in eastern cities, and sell enough grain to make marketing it themselves profitable. The Hites, for instance, shipped 280 barrels of flour to Korn and Wisemiller in Alexandria between January and June 1797, and at least 250 barrels in 1799 (Korn and Wisemiller 1796; 1799). By the 1830s,

Isaac Hite was shipping flour to Samuel Merritt in Baltimore (Merritt 1834). Enslavers who did not have mills could pay millers to grind their grains and then sell the barrels of flour/cornmeal to merchants in Alexandria, Baltimore, or Georgetown themselves. However, milling was expensive, and mill records show that most chose not to take on this added expense (Spring Mill 1830)..$^{45}$ Instead, they sold wheat, corn, or rye to millers or Valley grain merchants, who sold some to other Shenandoahans and marketed the rest to merchants in Alexandria, Georgetown, and Baltimore (Hopewell Mill 1811; 1818; Sperry 1839; Spring Mill 1830; 1847). ${ }^{46}$

Traces of these transactions can be found in surviving receipts and merchants' ledgers, letting us quantify how much grain enslavers sold and, by extension, demonstrate how enslaved farmers affected the local agro-capitalism. To see this, we need only compare the amount of grain/flour enslavers sold versus the amount non-enslavers sold. Unfortunately, tracking down receipts and merchants' ledgers from Alexandria, Baltimore, and Georgetown was not feasible. These records are in archives throughout Virginia, Maryland, and Washington D.C., and even if I had easy access to them, cross-referencing every account with tax and census records in the Valley would take an inordinate amount of time while only providing data on the wealthiest enslavers. Ledgers from Valley mills and merchants, alternatively, provide a less time-intensive way of getting data on the grains sold by Valley farmers, so I focused my efforts on these records. While these, admittedly, do not include sales from the wealthiest enslavers, they provide data on more people because selling to local mills/merchants was more common. Ledgers from Hopewell Mill outside Leetown (Jefferson County), Spring Mill in Winchester (Frederick County), and the Sperry Store in Middletown (Frederick County) are available in local archives.

[^39]However, I rely primarily on the Hopewell Mill ledgers because the relevant tax records for Jefferson County were easily accessible while the Frederick County records can only be accessed through in-person microfilm collections and I could not safely access these during the Coronavirus pandemic. Tax records are critical for this research. Census records only tell us who owned enslaved people, while tax records tell us who was using enslaved labor, because white Shenandoahans who hired (or in today's terms, rented) people from their enslavers typically paid the taxes on these women and men (J. Davenport 1832). Since hiring was common in the Valley (Simmons and Sorrells 2000), only having data on who owned enslaved people could severely underrepresent which Shenandoahans relied on enslaved farmers.

Five ledgers from the Hopewell Mill exist, covering the years 1807-1811, 1816-1818, 1818-1819, 1819-1821, and 1821-1823. From these, I transcribed all entries for individuals selling corn, rye, wheat, oats, and flour between 1807 and 1811 ( $\mathrm{n}=112$ ), and all entries for the sale of corn, rye, wheat, and oats in 1817 ( $\mathrm{n}=286$ ) (Hopewell Mill 1811; 1818) (Appendix D, Tables 2 and 3). The 1817 ledger records list barrels of flour bought from farmers and barrels of flour waggoners were paid to transport to Alexandria and Baltimore in the same way, so I could not use flour entries in this analysis. After transcribing the entries, account holders were crossreferenced with individuals listed in the 1807, 1809-1811, and 1817 Jefferson County tax records (Duncan 2003a; 2003b). Tax records for 1808 do not exist as Virginia did not collect taxes that year (Duncan 2003a, 98).

Of the 61 accounts in the 1807-1811 ledger, 25 (40.98\%) could be matched to the tax records, and $30.76 \%$ of these belonged to people who paid taxes on enslaved adult men during this time. ${ }^{47}$ Despite this, enslaver's accounts are responsible for over half of the wheat sales and

[^40]Table 5. Percentage of wheat, flour, rye, and corn sold to Hopewell Mill by enslavers, 1807-1811 and 1817. Data from Hopewell Mill Ledgers (1811; 1818) (see Appendix D, Tables 2 and 3).

|  | Cross- <br> Referenced <br> Account <br> Holders | Percent <br> Enslavers | Percent <br> Wheat | Percent <br> Flour | Percent <br> Rye | Percent <br> Corn |

over three-quarters of the corn, rye, and flour sales (Table 5). Enslavers who sold wheat sold, on average, 169 bushels while the average non-enslaver sold only 31 bushels, and enslavers who sold flour sold an average of 31 barrels while the average non-enslaver sold only 9 barrels. Fiftynine people sold grain to Hopewell Mill in 1817, of whom 28 ( $46.45 \%$ ) could be crossreferenced with the tax records. Sixty-four percent of the cross-referenced accounts belonged to people who enslaved women, men, and/or children over the age of 12 . The increased percentage of enslavers from the 1807-1811 ledger may be due to the inclusion of enslaved women and older children in the 1817 tax records. Enslavers accounted for $85 \%$ to $96 \%$ of the corn, rye, and wheat bought by Hopewell Mill in 1817. The average enslaver who sold wheat in 1817 sold 697 bushels while the average non-enslaver only sold 152 bushels.

Combined, this shows that enslavers sold far more grain/flour to Hopewell Mill than nonenslavers in the late 1800s to late 1810s. In fact, the numbers from Hopewell Mill are startlingly high, as enslavers sold the vast majority of the wheat, corn, rye, and flour. Since enslavers most likely relied on enslaved labor to plant and harvest grain, this suggests that Hopewell Mill predominantly bought grains/flour that enslaved farmers produced, or at the very least that they helped produce. These numbers are just for a single mill and only cover a few years. We need to look at more mill ledgers, and to be able to compare them with tax records once those can be safely accessed again. However, preliminary work on the Spring Mill ledgers shows that in

1825-1830 and 1843 accountholders listed as enslavers in the 1830 and 1840 censuses sold around $75 \%$ of the wheat, $82 \%$ of the flour, and $80 \%$ of the corn the mill bought (US Bureau of the Census 1830a; 1840c; Spring Mill 1830; 1847) (Appendix D, Tables 4 and 5). While we need tax records to fully understand these trends, the initial work suggests that Hopewell Mill was not an anomaly. This points to a profound way that Shenandoah Valley history needs to be reimagined. Currently, historians talk about the $19^{\text {th }}$-century Valley as a world made by wheat (Hofstra and Koons 2000), but this seems to be only half the story, as the Valley was a world made by wheat that enslaved women and men planted and harvested. Unfortunately for enslaved people, however, being able to affect the Shenandoah Valley's political economies also meant being able to be affected by them.

## Fluctuating Markets

A Negro Man Wanted. A liberal price in cash will be given for a stout, healthy negro man, well aquatinted with farming and wagoning. (Farmers' Repository 1811)

Enslaved Shenandoahans' agricultural labor was not the only way enslavers profited from Black flesh (sensu Spillers 1987). The sale and hiring out of enslaved people brought large influxes of cash/credit into Valley farms and plantations. Enslavers' decisions about when and who to sell/hire were influenced by fluctuations in the flour market. We can see this by comparing the annual number of advertisements for the sale and hiring of enslaved people in the Valley and trends in flour prices and exports. For this, we turn to the Farmers' Repository (18091820), Virginia Free Press \& Farmers' Repository (1830-1832), and the Virginia Free Press (1832-1841), a series of newspapers published by the same printer in Charlestown, Jefferson County. Charlestown is north of Winchester, placing it outside of our study area. But this is the most complete set of newspapers for the northern Valley I could find, with almost every issue
published in 1809-1820 and 1830-1841 being archived (Appendix D, Table 6). Importantly, these papers have (almost) complete runs for the years leading up to and the immediate aftermath of the Panics of 1819 and 1837, providing data on how enslavers reacted to market crashes. I transcribed every sale advertisement ( $\mathrm{n}=303$ ) and hiring advertisement $(\mathrm{n}=221)$ in these papers (Appendix D, Table 7).

The 1810s were a volatile decade for the flour market. The Napoleonic Wars (1803-1815) ravished Europe between 1803 and 1815. To starve each other, Brittan and France cut Europe off from American flour in 1807-1808 (Galpin 1927). However, this changed with the Peninsula War (1807-1814), where the French fought a coalition of British, Spanish, and Portuguese forces for control of the Iberian Peninsula. The conflict prevented Spanish and Portuguese farmers from growing enough food to feed the local population. By 1809 Portugal and Spain were the biggest markets for United States (US) flour, with 415,017 barrels of flour from Alexandria reaching the Peninsula in 1809-1813, accounting for $42.56 \%$ of all flour shipped out of, and $78.26 \%$ of all foreign exports from, the city (Galpin 1927, 424; Comp 1978, 273) (Appendix D, Tables 8 and 9). The War of 1812 (1812-1814), fought between Brittan and the US, did not severely impact Alexandria's exports until British forces captured the city in 1814, preventing flour from being shipped out and causing prices to plummet (Galpin 1927, 421, 427) (Figure 16). The Napoleonic Wars ended the following year and Brittan passed the Corn Laws, placing hefty tariffs on grain imported from the US (Sharrer 1982, 143). While losing access to European markets hurt Alexandria's flour trade, they turned their sights increasingly north to Boston and New York City and south to the Caribbean (Comp 1978, 273; Galpin 1927, 408; Rood 2014, 25; Sharrer 1982, 139), and in 1817 the flour market was back where it had been in the early 1810s. This prosperity, however, was short-lived, as the Panic of 1819 crashed the wheat market (Haulman
2008), and Alexandria merchants and Valley farmers produced and exported more flour to remain profitable. Some enslavers found other uses for their grains, with the Hites ordering enslaved people to distill wheat and rye and/or use them as "fed to fattening cattle" (Skinner 1821).

Fluctuations in flour prices and exports throughout the 1810s map onto trends in the advertisements for the sale of enslaved Shenandoahans (Figure 16). While wheat prices and exports were fairly high by the end of the 1800s, more enslavers placed sale advertisements in 1810 than in any other year between 1809-1820. At least $45 \%$ of the advertised sales were debtrelated (taking place to satisfy deeds of trusts or to pay debts owned by recently deceased enslavers). These may be a lingering effect of the c. 1808 European trade embargoes that depressed the flour market. In 1811-1813 sale advertisements were relatively rare, possibly because enslavers were focusing on producing flour to meet European demands. At this time listing enslaved farmers' skillsets became more common, with $41.7 \%$ of advertisements mentioning farming skills by 1813 , hinting at a growing demand for enslaved farmers. Sale advertisements increased in 1814-1817. Only $19.4 \%$ of these advertisements mention being debtrelated, but these years saw decreased flour prices and lower exports so debt and other financial concerns may have been important factors in these sales. In 1818-1820 sale advertisements become far less frequent once again and mentions of domestic skills become more frequent. Again, 1819-1820 were times of economic turmoil when enslavers needed to sell more flour to make up for decreased prices, so enslavers may have tried to navigate the Panic of 1819's financial fallout by selling fewer enslaved people so more could work in the fields and selling domestic laborers when they chose to sell people.

Figure 16. Advertisements for the sale of enslaved Shenandoahans, 1809-1820. All US dollars are converted to the value of the dollar in 1810. All sale data are from the Farmers' Repository (1809-1820) (see Appendix D, Table 7). Export data from Comp $(1978,273)$ (see Appendix D, Table 8). Price data obtained by averaging one reported price from every month of the year (see Appendix D, Table 10).

Figure 17. Advertisements for the hiring of enslaved Shenandoahans, 1809-1820. All US dollars are converted to the value of the dollar in 1810. All hiring data are from the Farmers' Repository (1809-1820) (see Appendix D, Table 7). Export data from Comp (1978, 273) (see Appendix D, Table 8). Price data obtained by averaging one reported price from every month of the year (see Appendix D, Table 10).

Trends in hiring advertisements suggest that the flour market affected enslavers’
decisions about when to hire enslaved Shenandoahans (Figure 17). Between 1808 and 1814 hiring advertisements were relatively uncommon, averaging only 3.3 per year. Of the 16 enslavers who placed hiring advertisements, only Richard Baylor hired out people in multiple years (Table 6). Baylor and his heirs (who hired out people enslaved by his estate after he died in 1811) advertised hirings every year in 1809-1814. Hiring advertisements increased to an average of 6.6 per year in 1815-1820. While most (72.23\%) enslavers still only published advertisements once, more were placing advertisements in multiple years. Richard Baylor's heirs still hired out enslaved people on an annual basis. Bacon Burwell and William Flood hired out enslaved people every year from 1815-1820, a practice they started in 1814. John and Mary hired out enslaved people every year between 1816-1820. And Matthew Whitting, who advertised in 1810 did so again in 1817 and 1818. We also see a shift toward hiring out people enslaved by the estates of deceased enslavers, making up $31.57 \%$ of the hirers in 1815-1820 but only $12.5 \%$ of the hirers in 1809-1814.

Table 6. Enslavers advertising the hire of enslaved Shenandoahans, 1809-1814 and 1815-1820. All hires are advertised in the Farmers' Repository (1809-1820).

We do not know how widespread unadvertised hiring was in the $1810 \mathrm{~s} .{ }^{48}$ But if the total number of hirings increased at the same rate as the advertisements, then the advertisements would indicate that hiring became more common throughout the decade. Alternatively, if the total number of hirings remained consistent throughout the 1810s, the advertisements show an increased sophistication of the assemblages through which hirings operated, as printing presses, newspapers, and the post offices that delivered papers to readers let news of upcoming hirings spread beyond word of mouth and helped bring hirers and hirees together (Rawson 2000). Either way, the advertisements document the development of a robust system of hiring in the northern

[^41]Shenandoah Valley. This emerged at a time when Alexandria lost its European grain/flour markets and Valley farmers needed to produce more grain to remain profitable, so these changes in hiring practices may be driven by some enslavers deciding it was more profitable to capitalize on others' need for labor than to produce more wheat themselves.

Flour prices rebounded during the 1820s and were largely within the 1810s price range by 1830. By this time merchants in Georgetown dominated the Potomac River trade, although some Valley flour was still marketed in Alexandria (Comp 1978). By 1833, most flour sold to Alexandria and Georgetown was exported to US cities (56.43\% of exports) or foreign markets ( $43.57 \%$ of exports) (Comp 1978, 274). Baltimore, however, outcompeted Georgetown and Alexandria combined in the 1830s, becoming the leading US flour exporter in the early 1820 s and was second only to New York City by 1830 (American Farmer 1858, 263; Comp 1978, 27374, 279-80; Merchants' Magazine 1861, 132) (Appendix D, Table 11). In the 1830s Baltimore merchants controlled lucrative flour markets around Rio de Janeiro, Brazil (Rutter 1897; Sharrer 1982). By 1840-1844, Baltimore merchants were shipping around 127,309 barrels of flour per year to South America (50.52\% of foreign exports), and around 99,121 barrels per year to the British Caribbean (39.34\% of foreign exports) (Rutter 1897, 18) (Appendix D, Table 12). In 1828-1835, flour prices stayed relatively constant in Alexandria and Baltimore (\$6.12-7.91 and $\$ 6.53-8.86$, respectively) (Figure 18). ${ }^{49}$ However, in 1836 a severe hessian fly (Mayetiola destructor) infestation hit wheat fields throughout the United States (McGrane 1924, 92), reducing the amount of wheat Valley farmers could sell while prices rose to over $\$ 11$ per barrel. The Panic of 1837 began the following May, deflating US currency well into the 1840s (Lepler 2013). While the Panic devastated cotton markets (Rothman 2012), flour markets went

[^42]

Figure 18. Advertisements for the sale of enslaved Shenandoahans, 1830-1841. All US dollars are converted to the value of the dollar in 1810. All sale data are from the Virginia Free Press \& Farmers' Repository (1830-1832) and Virginia Free Press (1832-1841) (see Appendix D, Table 7). Export data from American Farmer (1858, 263), Comp (1978, 273-74, 279-80), and Merchants Magazine (1861, 132) (see Appendix D, Table 11). Price data obtained by averaging one reported price from every month of the year (see Appendix D, Tables 10 and 14).
seemingly unscathed (likely because they were already devastated by the Hessian fly), with prices slowly dropping to around $\$ 7$ per barrel in 1840 as farmers recovered from the hessian fly and began selling more flour.

As with the 1810s, the flour markets seem to have influenced enslavers' decisions about when to sell enslaved Shenandoahans. Between 1830 and 1836, an average of 15 sales were advertised per year (Figure 19). Many of these advertised sales were debt-related. In fact, 18301836 has the highest percentage of debt-related advertisements in the entire dataset. However, it

Figure 19. Advertisements for the hiring of enslaved Shenandoahans, 1830-1841. All US dollars are converted to the value of the dollar in 1810. All hiring data are from the Virginia Free Press \& Farmers' Repository (1830-1832) and Virginia Free Press (1832-1841) (see Appendix D, Table 7). Export data from American Farmer (1858, 263), Comp (1978, 273-74, 279-80), and Merchants Magazine (1861, 132) (see Appendix D, Table 11). Price data obtained by averaging one reported price from every month of the year (see Appendix D, Tables 10 and 14). is worth noting that voluntary sales also took place during this time. In 1837 enslavers began placing fewer advertisements, and through 1841 we only see an average of 5.6 advertisements per year. This corresponds with the drop in wheat sales following the Hessian fly infestation and the lingering financial effects of the Panic of 1837. Therefore, we see a similar trend to 18091820, with enslavers being more likely to advertise the sale of enslaved people when the flour markets are doing well, and less likely to do so when they were not.

Hiring advertisements follow roughly the same pattern as the 1830s sale advertisements (Figure 19). In 1830-1835 hiring was common, with an average of 14.6 advertisements per year. This does not correlate with trends in the flour market, so other factors might account for the increased advertisements at this time. In 1836-1839 the number of hirings advertised dropped to 9.3 per year. Again, this corresponds with the hessian fly and financial instability from the Panic of 1837 , so just as enslavers sold fewer people during this time, they also hired out fewer Shenandoahans. Unlike the sale advertisements, advertised hirings increased to 18 per year in 1840-1841, a time when Baltimore merchants were buying more flour. In 1830-1841, a
significant number of hirers took out advertisements in multiple years. This was relatively consistent between 1830-1835, 1836-1839, and 1840-1841 ( $35.29 \%, 40.74 \%$, and $34.48 \%$, respectively). Enslavers' estates consistently hired out enslaved people in 1830-1841, accounting for $32.16 \%$ of advertisements.

There are more hiring advertisements in 1830-1841 than 1808-1820 (158 vs. 63). This suggests that either more enslavers were hiring out enslaved people in the 1830s, or they more commonly turned to newspapers to advertise hirings. More importantly for our discussion of flour markets, the 1810s data suggests that the increase in enslavers advertising in multiple years and the increase in estates advertising hirings may have been responses to sluggish flour markets and financial collapses in 1815-1820. However, the 1830-1841 data do not show enslavers increasingly using these strategies after 1836, suggesting that they had become commonplace and were no longer responses to market fluctuations.

We can see each advertisement used in the preceding analysis as an assemblage, as a unique composition formed by, among other things, articulations of newspapers, enslaved Shenandoahans' aptitudes/skills, their enslavers' desire for profit, and discourses that placed Black people into forms of humanity that could be bought and sold. The correlations between fluctuations in the flour market in Alexandria, Georgetown, and Baltimore and trends seen in advertisements for the sale or hire of enslaved Shenandoahans also indicates that trans-Atlantic political economies were part of these assemblages. As assemblages, we cannot say that shifts in the flour markets directly caused the trends we observed in the advertisements. But how the advertisements repeat across time and space map onto the ways the flour market repeated, strongly suggesting that the advertisements are at least influenced by changes in the flour market. By extension, this means that fluctuations in the flour market impacted the lives of enslaved

Figure 20. Runaway advertisements per year, 1808-1820 and 1830-1841. All advertisements were published in the Farmers' Repository (1808-1820), the Virginia Free Press \& Farmers' Repository (1830-1832), and Virginia Free Press (1832-1841).
women, children, and men in the Shenandoah Valley, helping to shape enslavers' decisions about when lovers, mothers and children, families and friends would be taken from one another and sent elsewhere, sometimes for a year, sometimes for a lifetime. And it seems that enslaved Shenandoahans recognized this. There is a large increase in runaway advertisements in 1819 and during the Hessian fly infestations of 1836 and the financial issues caused by the Panic of 1837 (Figure 20). While the decision to seek one's freedom was influenced by a variety of factors (e.g., B. Dew 1856, 46; Noyalas 2021, 21-23), the sudden uptick in advertisements during times of financial instability strongly suggests that the flour market, and a fear of being hired out or sold, were among these factors. In the following chapter, we explore another condition that may have led enslaved people to seek their freedom - the constant threat of hunger from the inadequate rations issued to enslaved people.

## Chapter 6: Hunger

What does hunger outside the world of Man feel like? Is it a different hunger, or just the same as the famines created by racializing assemblages that render the human isomorphic with Man? (Weheliye 2014, 113)

Frederick Douglass $(1845 ; 1855)$ provides some of the starkest and most provocative passages about food, hunger, and slavery. He writes that the pork enslavers issued as rations "was often tainted, and the fish of the poorest quality," while the corn "was fit only to feed pigs" $(1855,78)$. Douglass describes racing against other enslaved children to scoop up as much corn "mush" as possible from "a large wooden tray or trough," because "[h]e that ate fastest got [the] most" - although "few left the trough satisfied" $(1845,27)$. Because of this he continually endured the "bitter pinches of hunger," and "did not hesitate to take food... wherever [he] could find it," even if it meant fighting "with the dog... for the smallest crumbs that fell from the kitchen table" or eagerly awaiting scraps "flung out for the cats" (Douglass 1845, 51, 109; 1855, 58, 147). While Douglass and those he was enslaved with were "nearly perishing with hunger... food in abundance lay mouldering in the safe and smoke-house" (1845, 52).

Douglass brings into focus the gastronomic violence that oriented (sensu Ahmed 2007) enslaved people away from adequate food within enslaving assemblages, placing a full stomach just out of reach, just on the other side of a locked door. While archaeological studies of food provide important datasets for exploring enslaved life (Landon 2005), we have not used them to narrate slavery in ways that fit with Douglass's writings. Part of this is because we often recover large quantities of animal bones and ethnobotanical remains from quartering sites. This abundance of evidence, which accumulated over years, if not decades, gets implicitly taken as evidence of abundant, or at least adequate, food, making discussions of hunger seemingly unnecessary. We frequently note that these remains came from hungry enslaved people getting
food for themselves (e.g., Bowes 2011; Brunache 2019; McKee 1999), but we gloss over hunger because it was (sometimes) eventually sated instead of seeing it as a place for critical inquiry. Part of this is also because white supremacy and liberal humanism make Black women's, children's, and men's emotions unthinkable and unknowable (D. W. King 2008; Palmer 2017). As a result, we often use phrases like "food (in)security" or "dietary deficits" instead of "hunger" (e.g., Franklin 2020; L. A. Lee 2016; Peres 2008; Wallman 2018; Wallman and Oas 2020), rhetorical choices that elide the fact that we are talking about histories of mundane pain and suffering (Hartman 1997, 51)..$^{50}$

One way to address hunger is through food's materiality, its affective, vibrant qualities (sensu Bennett 2010) that infuse people with life-sustaining energy and whose absence (sensu Fowles 2010) leads to hunger pangs, crying children, and death. We have discussed enslaved people's relation to food from cultural-evolutionary frameworks that see the enslaved as homo economici rationally exploiting food resources (e.g., Bates 2016; A. L. Young 1997; Young et al. 2001), and poststructuralist studies of identity (e.g., Ferguson 1992; Samford 2007; Mrozowski et al. 2008), resistance (e.g., Ferguson 1991; McKee 1999; Brunache 2019), or community formation (e.g., Bowes 2011; Crowder 2021; Wilkie and Farnsworth 2005). And we are starting to talk about the ecological connections food engendered (e.g., Oas and Hauser 2018; Wallman 2018; Wallman and Oas 2020). But we leave out food's physical properties, the juicy fattiness of pork, the dry tastelessness of ashcakes, and the material effects of their nutritional content. This

[^43]chapter leans into food's materiality to address how hunger shaped enslaved life in the Shenandoah Valley.

When hunger is experienced as a banal reality, as "regular," "rhythmic" and "always anticipated," it "orient[s] time, space, and action, lingering as a specter in everyday life" (K. Phillips 2018, 5). And, as Kristen Phillips $(2018,12)$ argues, "[t]he threshold for subsistence," that gap between being made to be hungry and being allowed to be full, can become "political... space[s] of... frenzied activity" related to the performance, denial, and endurance of suffering (also see Griffin 2020; Nally 2011). In this chapter's epitaph, Alexander Weheliye $(2014,113)$ asks what hunger feels like for those deemed differently human within the logics of liberal humanism, for those rendered the human other to white economically privileged men (also see Gay 2017; Simpson 2016; R. Wright 1977). Reading Weheliye through Phillips, we see hunger acting and feeling differently for those continually haunted by it, and that access to adequate food can become a way of defining who counts as fully human (also see Leong 2016). Below, I ask what hunger did to those enslavers deemed differently and enslaveably human. How did a lack of sufficient food become a critical component of enslaving assemblages in the Shenandoah Valley? How did finding ways to redress hunger animate enslaved life? And what effects did these acts of redress have?

Hunger, I argue, was a critical arena in the contested politics of being that played out in plantations throughout the Americas. Enslavers defined Black women, children, and men as differently and enslaveably human by coupling inadequate rations of cornmeal and salted pork with discourses that argued that this food was enough for enslaved people, thereby denying hunger. Such denials, however, did not stop hunger from being part of the material realities of slavery, and to deal with this hunger, many enslaved women and men grew and gathered plants,
raised poultry, and hunted. Through this, they redefined themselves as people who could not survive on the limited rations they were issued. These acts of redress created ways for enslaved people to participate in local economies by selling excess food, but enslavers also found ways to capture and pervert these efforts to further the institution of slavery. In this chapter, I foreground anti-black violence and how enslaved Shenandoahans redressed the pain it caused to highlight aspects of enslaved life that get left out when we gloss over hunger. This is only part of the story of food and slavery in the Valley. In the following pages, I gesture toward other aspects of food, but I do not extensively engage with them so I can keep our focus on hunger. We will return to food and the ways it affected enslaved life in the following chapters.

## Calculated Hunger

No human could live on that kind of diet and survive...
(Twitty 2017, 198)
Early- $19^{\text {th }}$-century enslavers issued a peck (around two gallons) of cornmeal and 3.5 pounds of salted pork to enslaved men every week (Coleman 1845; S. G. Moore 1989; Simple 1821; Tattler 1851). Some women got the same amount of food, but most received less, as did all children (Cocke 1853; Ruffin 1842; Tattler 1851). ${ }^{51}$ It was not uncommon for enslavers to swap some of the salted pork for salted fish (H 1837; Pauling 1836; Ruffin 1842; J. H. Turner 1842), and some Valley enslavers may have done this as several bought barrels of herring and mackerel (Sperry 1839). Agricultural treatises and periodicals circulated widely in the Valley. ${ }^{52}$ Many contained essays written by enslavers condemning those who did not issue the standard amount

[^44]of food and/or recommending others try their feeding regimes, which often involved additional cornmeal or supplemental rations of molasses, milk/buttermilk, turnips, sweet potatoes, and/or other vegetables (Farmers' Register 1837a; H 1837; Old Southampton 1846; Pauling 1836; Southern Planter 1851; Tattler 1851; J. Taylor 1814; J. H. Turner 1842; X 1841). Some historians take this as evidence that enslaved people's rations were not limited to cornmeal and salted pork/fish (e.g., Breeden 1980; Fogel and Engerman 1974; U. B. Phillips 1969). But such arguments seemingly misinterpret recommendations to improve rations as evidence for their widespread implementation, especially since nutritional deficiencies like anemia, pellagra, and scurvy plagued enslaved Southerners (Gibbs et al. 1980; Kiple and King 1981; Savitt 1978). These calls also do not reflect early- $19^{\text {th }}$ century rationing systems, as they rarely occur before the mid-1830s (Gibbs et al. 1980, 178). However, since we know that Valley enslavers started reading these recommendations in the 1830s, some may have (eventually) issued extra rations.

We only have a few scattered accounts of rations in the Shenandoah Valley. In 1797 an unnamed Quaker reported that enslavers issued "only on bread and water, sometimes with milk" in Berkely or Jefferson County (Niemcewicz 1965, 91). Catharine Slim (1972, 79), recalled only eating pork, corn, and rabbits (the latter was probably hunted and not issued as rations) when she was enslaved in Rockingham County in the 1850s-1860s while her enslavers got to eat "eberythin' nice." Jourden Banks $(1861,15)$, enslaved in Rockingham County in the opening decades of the $19^{\text {th }}$ century, stated that "both the quality and quantity of the food" issued to enslaved farmers was worse than that of enslaved domestic laborers. A more complete picture of enslaved people's rations can be gleaned from James Pennington's account of being enslaved at a wheat farm in Washington County, Maryland, which lies immediately north of the Valley, and is occasionally considered part of the broader Shenandoah Valley cultural region (e.g., Comstock

1994b). In the 1820s, Pennington (1849, 65-66) was issued 3.5 pounds of "salt pork" or 12 herring per week, cornmeal, and "occasionally... allowed milk." He further adds that rations never included "butter... potatoes, cabbage, \&c." The only exception to this diet was during the two to three weeks of the wheat harvest, when additional "harvest provisions" of "fresh meat, rice, sugar, and coffee" were issued (Pennington 1849, 66).

At Belle Grove, Isaac Hite’s kept "meat records" in 1836 (I. Jr. Hite 1847), which include entries for "Provision for Walker's servants," which is presumably rations issued to people enslaved by his son Walker Hite. This includes weekly provisions of "bacon" and beef between 23 February and 29 November. From 8 March through 9 September only bacon was issued, while a mixture of bacon and beef were issued before and after these weeks. This suggests that salted pork was the predominant meat issued to people enslaved by the Hites, at least for most of the year. The amount of meat also varied throughout the year. From 8 March to 10 June, the records indicate $16.5-17$ pounds (mean of 16.79 pounds) of meat issued as provisions, the remaining weeks ranged from between $9.75-16.5$ pounds (mean of 13.31 pounds). Walker Hite enslaved 16 people in 1840, eight of whom were probably adults (US Bureau of the Census 1840c). If he enslaved this many people four years earlier, the rations issued by his father would come out to around two pounds of meat per adult per week from March through early June, and one to two pounds per adult in late June through November. If this was all the meat they were issued, this would have been below average for the South as a whole, but in line with what James Smith $(1881,8)$ recalls being issued while enslaved in Virginia Tidewater in the 1810s-1820s or Peter Randolph $(1893,179)$ states he was issued in Prince George County, Virginia in the 1830s1840s ( 2 pounds per man and 1-1.5 pounds per women). This would not leave much, if any, meat for enslaved children, but numerous references to enslaved children receiving little or no meat
exist throughout the South (e.g., Parker 1895, 17; J. L. Smith 1881, 8). It is important to note that this may not have been the only meat issued to people enslaved by Walker Hite, but this data does suggest that the Hites were probably not issuing more meat than other Southern enslavers, and in fact may have routinely issued less than the 3.5 pounds commonly seen elsewhere.

Enslavers commonly stated that the food they issued provided a "sufficient" and "wholesome" diet (A Virginian 1849; Barksdale 1856; Calhoun et al. 1846; Farmers' Register 1837a; Gooch 1833; J. H. Turner 1842). But if we are just talking about the rations of cornmeal and salted pork, this cannot have been the case. ${ }^{53}$ Enslaved farmers worked long, grueling days Monday to Saturday throughout the year, typically laboring from "daybreak... until dark, with the intermission of half an hour to an hour at breakfast, and one to two hours at dinner, according to the season and sort of work" (Pauling 1836, 181). This probably occurred in the Valley as well, as George Johnson (B. Dew 1856, 52) recalled going "to work at sunrise, and quit[ting] work between sundown and dark" while enslaved "near Harper's Ferry," either in Jefferson County (now West Virginia) or across the Blue Ridge in Loudon County. This meant that the length of the workday varied widely, from as little as 5.5 hours in mid-December to as many as 14.5 hours in mid-June. ${ }^{54}$ The amount of energy enslaved Shenandoahans needed to do this forced labor also varied throughout the year, and from person to person as a host of factors, including weight, affect how many calories people burn. ${ }^{55}$ We can see this with Jerry, Ned, Primus, Sally, and Truelove, five enslaved farmers assigned to work under Benjamin Little, the

[^45]Hites' overseer in 1786 (I. Hite 1785). We do not know how much these people weighed, but let us say that Jerry weighed 65 kg (143 pounds), Ned weighed 74 kg (163 pounds), Primus weighed 83 kg (183 pounds), Sally weighed 51kg (113 pounds), and Truelove weighed 56kg (123 pounds)

- weights we might expect to see based on documentation in runaway advertisements (e.g.,

Bourland 1828; Crittenden 1791; Eaton 1784; Irvine 1802). Primus might have burned as little as
2,813 calories working in December and as many as 6,075 calories in June while Sally might
have burned as little as 2,201 calories working in December and as many as 4,755 calories in June (Table 7). ${ }^{56}$ If we assume the smallest possible energy expenditure for the rest of the day, Primus may have burned between 4,352 and 6,986 calories per day while Sally burned between 3,283 and 5,395 calories per day. ${ }^{57}$

If we take the rations issued to Jerry, Ned, and Primus to be the peck of cornmeal and 3.5 pounds of salted pork that were commonly issued in the South (which again might be more food than the Hites issued), these would have provided them with around 3,282 calories per day. ${ }^{58}$ This was not enough food at any time in the year and fell far short of what they needed when harvesting wheat and rye in early summer 1786. We do not know how much food the Hites

[^46]Table 7. Calculations for Jerry, Ned, Primus, Sally, and Truelove's estimated daily energy expenditures.

issued to enslaved women, but if they gave Sally and Truelove the same rations as the men, the cornmeal and salted pork was never enough food for Truelove and would only have been enough for Sally in December. I may have over-calculated the energy expended during work hours, but even reducing this by $25 \%$ the rations only provided enough food for Jerry, Sally, and Truelove
in the winter months. Based on account of formerly enslaved people throughout the South, estimating anything below this would likely undercount the amount of work done by enslaved farmers. If the Hites issued "harvest provisions" like those described by Pennington $(1849,66)$, these could have alleviated (some of) the caloric deficit seen in the summer, but only for the few weeks when people were directly engaged in the wheat harvest. For Ned and Primus, "hunger" would have been their "daily companion" throughout (most of) the year (R. Wright 1977, 1). According to records from Belle Grove, Sally and Truelove were not pregnant or nursing in 1786, but if they had been, the issued rations would not have been adequate; Virginian enslavers did not issue extra rations to pregnant or nursing women, and mothers-to-be did fieldwork into the ninth month of their pregnancy (Pargas 2010, 64-65; Stevenson 1996, 193, 250). I calculated the smallest possible energy expenditure for time not spent doing fieldwork. If these women and men cooked, ate, or did anything other than sleep during this time then their daily caloric needs would be above what I estimated. In 1786, Truelove had a son (Henry, aged six) and three daughters (Peggy, aged 10; Pricilla, aged eight; and Katy or Kate, aged four) (Madison 1785). If we recognize the time and energy she put into raising her family, a peck of cornmeal and a few pounds of salted pork were probably not enough food, even in the winter.

Hunger affected all five enslaved farmers. How much it affected them varied from person to person, but all felt the bitter pinches of hunger most acutely during the wheat and rye harvest. Some may have suffered in silence, moaning under their breath for fear of the violence Little might inflict on them if they mentioned being hungry in June and July (see Grandy 1843, 12). Their thoughts may have turned inwards, serving up fantasies of food while they sweated in the late-afternoon heat (Weheliye 2014). Did these fantasies sustain Truelove, helping her to keep going until the sun dipped below the horizon? Did such thoughts intensify Jerry's hunger pangs,
making the sun seemingly slow its progress across the sky, stretching out the hours until he could eat again (see Clarke 1845, 29)? Others might have been vocal. Isaac Hite noted that Primus might refuse to "work in the crop" as he had "not given in" to being enslaved (I. Hite 1785; 1859). We can easily imagine Primus protesting the gastronomic violence imposed on him regardless of the punishment. Some enslavers withheld rations as a form of punishment (e.g., Anderson 1857, 17; Clarke 1845, 25; Jacobs 1861, 72), so Little may have denied Primus food to force him to "work in the crop," compounding his hunger.

What I have presented are a series of speculative statistics based on sparse historical documents. These are not quite critical fabulations, re-presentations of "sequence[s] of events in divergent stories... from contested points of view" made popular in Black studies by Saidiya Hartman $(2008,11)$. But they do the same work, displacing authorized narratives about the (lack of) hunger felt by enslaved Shenandoahans by discussing how different enslaved people may have experienced hunger at different times of the year, making legible what was not written down (Hartman 2008, 11-12). This amplifies and contextualizes the writings of John Adams $(1872,15)$, who recalled that "many" of "the fathers and mothers who" were enslaved alongside him in Fredrick County "were starved to death." I did this by privileging the experiences of enslaved farmers over enslaved artisans, domestic laborers, and children. This is partly because I do not have enough information to speculate on the needs of those not engaged in fieldwork, and partly because people like Judah or Sukey who worked in Belle Grove's manor house may have had access to scraps of leftover food. Or they might have been punished if they ate these, with the sights and smells of the kitchen and the dining room intensifying their hunger (e.g., Jacobs 1861, 22; James 1936, 170; Webb 2020, 142). We do not know. But we do know that most enslaved women and men worked in the fields "during the busy seasons" around harvest and
planting (Farmers' Repository 1816b, see Chapter 5). This means that most enslaved adults at Belle Grove, and in the Shenandoah Valley, felt the same bitter pinches of hunger that affected Jerry, Ned, Primus, Sally, and Truelove in the summer of 1786.

Why did enslavers inflict this gastronomic violence on enslaved Shenandoahans? To put it differently, what did this imposed hunger do for enslavers? What did they get from starving the women and men whose labor they relied on? Part of this seems to revolve around profits. Racializing access to adequate food created a calculated hunger that satisfied profit margins instead of the women and men who produced this wealth. Most enslaved Shenandoahans ate corn and pork that they grew/raised for their enslavers, so this food did not cost anything to acquire. But these were also marketable commodities, with the annual value of the cornmeal and salted pork issued to enslaved men coming to around $\$ 20.46$ in 1838 (\$572.85 in 2020). ${ }^{59}$

Enslavers calculated the cost of feeding enslaved people as business expenses (Ruffin 1842;
Simple 1821; Southern Planter 1846b). Some bemoaned this loss of potential profit as enslaved people "eat[ing]," "starv[ing]," or making "slave[s]" of their enslavers, and there are reports of Virginian enslavers selling people to make up for these lost profits (Silliman's Journal of Science 1836, 98; Southern Planter 1846b; T.B.A. 1835, 612). One South Carolina enslaver even recommended grinding corn cobs into cornmeal to increase the amount of food that could be issued to enslaved people (Amphicon 1825). When we look at this calculated hunger from $20^{\text {th }}$ and $21^{\text {st-century understandings of the human as a homo economicus (e.g., Wynter 2003), or }}$ contemporary understandings of labor, this does not necessarily make sense. Again, why starve a worker who makes money for you. But Leonard Black (1847, 16-17, my emphasis), who was enslaved in Maryland, points out a different economic logic that was at play here. "We were poor

[^47]slaves; and the great object in feeding slaves is doubtless the same as it is with cattle and horses, to keep them in good working order," which he specifically states not as a state of good health, but in a "saleable condition." He goes on to argue that:
if the health of the slave is not permanently injured, the nearer to the starvation point the master can keep the slave, the more it is for his interest; and who, that casts his eye back through the dark, bloody track of slavery, does not perceive that the masters have acted up to their interest

Furthermore, as Charles Ball $(1859,33,79)$ notes, the logic behind this calculated hunger lead to "half-starved... wretches" showing up wherever people were enslaved, from large plantations to small family farms. Profit alone, however, cannot explain why enslavers issued so little food to enslaved people. Enslavers gave more food to white laborers, even though this, too, ate into their profits (A Virginian 1849; J.S. 1841a; 1841b; C. Jones 1828; Veney 1889, 32). As a point of comparison, the typical diet of a White Shenandoahan included 5.9 pounds of corn and wheat, 3.5 pounds of potatoes, 2.7 pounds of pork, 1.3 pounds of beef, and 0.6 pounds of mutton per week as well as "large amounts" of poultry, fruits, vegetables and dairy products (Schlebecker 1971, 464). This comes out to around 3,525 calories per day from starches and meat, which is more than calories than enslaved rations likely provided even without counting the other items in White diets. Therefore, I argue that we are seeing an ontological politics waged over the definition of enslaved people's humanity playing out through cornmeal and salted pork (Wynter 2003, 318).

For Africans to be enslaved, they had to be defined as differently and enslaveably human, as inhabiting a racialized form of humanity that was ontologically different from their enslavers, a way of being human that was "burdened with the specter of abject" enslavability (Z. I. Jackson 2020, 27; Judy 2020, xiv). And the banal hunger inflicted on enslaved people was "a technology for producing" and describing this "kind of human" (Z. I. Jackson 2016, 96; also see Leong
2016). As Zakiyyah Jackson (2020, 9-12, 26) discusses, enslavers defined enslaved people as being so entrapped by corporeal pleasures that they could not act "rationally" - which supposedly prevented them from being fully human. While such discourses typically focused on sexuality, they also took place around food. Some enslavers argued that if rations were increased, enslaved people would eat more than they needed or sell their food "for a gallon of whiskey, or a pound or two of tobacco" (A Planter 1836, 574; R. H. Taylor 1924, 139; also see Clay 1833, 11; K. M. Hilliard 2014, 25). One sensationalized story, reprinted in a Valley newspaper, even told of an enslaved man who "met his death by overeating" (Farmers' Repository 1817). Others claimed that enslaved people could not be trusted with extra rations because they would steal from each other (Tattler 1851, 39). As Valley enslavers read these discussions, they became assembled with discourses that used enslaved people's supposed irrational and insatiable desires to justify limited rations and to define them as differently and enslaveably human.

The decision to feed enslaved people cornmeal and salted pork fed into these ontological politics and the racializing sciences used to justify them. Eighteenth-century enslavers argued that corn was "the properest food for Negro slaves," and that those who ate other grains would be physically weakened (Catesby 1754, xvii). White Virginians also ate large amounts of corn, but it was not seen as a biological necessity for them in the same way that enslavers argued it was for enslaved people (Catesby 1754, xvii). What this seems to show is that by the $18^{\text {th }}$ century, enslaved people were being defined as differently human based on their perceived nutritional needs. These discourses continued into the $19^{\text {th }}$ century, where lean foods (wheat, vegetables, etc.) were classified as "muscle-producing" while fatty foods (especially fatty meat) were considered "heat producing" (Wilson 1859, 197; also see Tompkins 2012, 53-88). Corn fell into both categories, seen as "abounding... in oily," heat-producing "matter" while being "a valuable
muscle-producing food" (Wilson 1859). At the same time, enslavers described Black people as producing less heat than White people because of their adaptation to tropical environments, a view that circulated widely in the Valley (W. Ballard 1854; Barksdale 1856; Franklin 1820; 1839; W. H. Harrison 1831; Home 1821; C. Jones 1828). This led enslavers to see fatty salted pork as "the most nourishing of all foods" for enslaved people (A Lover of Good Ham 1843; Breeden 1980, 111; Draughon 1850; Gage 1857; Holston 1858, 729; Wilson 1859, 197). ${ }^{60}$ Enslavers eventually debated whether fatty meat was deleterious to White people (Barksdale 1856; Wilson 1859, 197; also see Tompkins 2012, 53-88), creating another way to define White and Black Southerners as different. Because corn provided heat while promoting "muscular growth," enslavers viewed it as the most appropriate grain for the enslaved (Breeden 1980, 111; Wilson 1859).

Notions of enslaved people's fungibility also played a critical role in creating and denying the hunger felt by enslaved Shenandoahans. Enslavers attempted to negate differences between enslaved women, children, and men so they could "be arranged and rearranged for infinite kinds of use" (Hartman 1997; T. L. King 2016, 1025; Spillers 1987). When assigning rations, enslavers recognized at most two distinctions between enslaved people - an age difference between children and adults, and a gender difference between women and men. Other differences in weight, height, age, metabolism, the work enslaved people did, and whether women were nursing or pregnant were left out of the crushing arithmetic said each woman, each child, and each man had the same dietary needs and that these needs could be satisfied by the assigned rations (also see McKittrick 2014). Tyrone Palmer (2017, 37) argues that fungibility

[^48]"foreclose[s] or [at least] heavily circumscribe[s]" the possibility "of Black sentience," rendering enslaved women and men as people "whose... affective power is of no consequence," as emotions are not interchangeable and require dealing with the needs of individual people. As a result, the pain created by insufficient rations was obscured, to say nothing of every enslaved person experiencing hunger differently or having different fantasies about food.

These definitions of Black people as incapable of regulating their food intake, possessing a biological need for cornmeal and salted pork, and the interchangeability of their dietary needs informed White Shenandoahans' decisions about how much of which foods to give the women, children, and men they enslaved. As a result, the hunger felt by enslaved people was rendered different from the hunger White people felt, requiring different foods to satisfy and different levels of concern for enslavers than hunger felt by better-fed White laborers. The physical effects of this hunger also fed back into understandings of Black people as ontologically different, with one enslaver arguing that enslaved people possessed inferior "energy" (Williams 1859, 35), quite possibly an effect of the hunger that haunted them.

## Hunting, Raising, Growing, and Gathering

No matter how White Shenandoahans defined enslaved people's biological needs, the cornmeal and salted pork issued to enslaved women and men was not enough food, at least for most of the year. This is because the ontological categories enslavers placed enslaved people into were uninhabitable, as discourses about Black people's biologies did not change their dietary requirements, nor did they imbue rations with additional calories. Enslaved people needed more food than they were given. In some ways, we might say that the rations did not produce enough "friction" to give enslaved people the life-sustaining energy they needed, while in other ways we might say that this hunger chaffed them, creating discomfort and pain, shaking hands and aching
stomachs (T. L. King 2019; Macharia 2019; Tsing 2005). Many (if not most) sought redress from this by doing what they could to get extra food. Some stole from their enslavers or neighboring properties. Others had gardens or raised poultry. Through these actions, enslaved people enacted a counter-politics of being that redefined themselves as people who could not subside on a peck of cornmeal and a few pounds of salted pork a week. It is important to note that these actions were carried out at night or on Sundays, which was the only time enslaved people were not required to work (e.g., Ball 1859, 202-3; B. Dew 1856, 55; Northup 1853, 200; Pennington 1849, 66; Pickard 1856, 124; J. L. Smith 1881, 8-9).

Such redescriptions of enslaved humanity occurred throughout the Shenandoah Valley. Archival records show that enslaved Shenandoahans grew corn, sorghum, rye, and other crops for themselves in "negro patches" (Norris 1890, 802; Page News \& Courier 1932; Simmons and Sorrells 2000, 177; Sperry 1839; Spring Mill 1830). They also raised fowl for meat and eggs (Baker Store 1861; Milton 1849; Gore 1860; Griffith 1862). Some enslaved men bought gunpowder and lead shot, presumably for hunting (Account Book 2 1797; Cather 1882; Milton 1849). While technically illegal (Guild 1969, 51), several raised pigs and cows, and even made their own butter (Milton 1849; Gore 1860; Griffith 1862; Homer and Nelson 1858; Southern Claims Commission 1878; Sperry 1839). But the best source of data on how enslaved Shenandoahans satisfied the hunger imposed on them are the ethnobotanical and faunal remains from Belle Grove Plantation's Quarter Site B, particularly those from the burned cabin's root cellar (Feature 3) and subfloor pit (Feature 24).

Figure 21. Ethnobotanical specimens from subfloor pit (Feature 24). A) walnut shell, B) peach pit, C) corn cobb, and D) various seeds.

The ethnobotanical analysis from the cellars is ongoing (Seminario Forth.), but the initial results suggest that enslaved people grew and gathered a variety of food (Figure 21). Linda Seminario has identified corn (Zea mays) cobs and kernel fragments. Cornmeal was more commonly issued as rations than whole corn, so corn cobs suggest that enslaved people at Belle Grove grew corn for themselves. Seminario also identified charred parenchymous tissue from tubers. Amongst these is a possible potato or sweet potato eye, suggesting that enslaved people also grew root crops. Peach (Prunus persica) and cherry (Prunus sp.) pits were found in the cellars. References to enslaved Southerners planting and raising fruit trees exist, as do references to enslaved people getting fruit from enslavers' orchards (e.g., Covey and Eisnach 2009), so we do not know where the peaches and cherries came from.

Other ethnobotanical materials provide better evidence for enslaved people gathering food. Seminario identified walnut (Juglans sp.) shells, suggesting that enslaved people gathered nuts in the fall. The ethnobotanical remains also include knotweed seeds (Polygonum sp.), a weedy plant with edible greens commonly found in Virginian quartering sites (e.g., Bowes 2011, 96; Crowder 2018, 63, 122, 125-26; Henderson 2013, 9; Mrozowski et al. 2008, 719). Knotweed
prefers wet soils (Henderson 2013, 9), and Quarter Site B sits on a well-drained ridge top where it was unlikely to have grown. Enslaved people probably gathered knotweed from wetter areas, especially around Cedar Creek or Mill Brook to eat its leaves. Residue analysis from the site's ceramics (see Chapter 8) also indicated that enslaved people ate cruciferous vegetables, likely cabbage or turnip greens. Finally, Seminario noted chickasaw plum (Prunus angustifolia) pits, a wild plum that fruits in May and June.

The faunal analysis (Bajorek In Press; Oliver Forth.) also shows enslaved people at Belle Grove doing what they could to get food for themselves. The most common animal bones from the site are from cows, pigs, and sheep/goats. Archival records show that enslaved Shenandoahans raised cows and pigs for themselves. But enslaved people also raised these animals for the Hites, and we cannot discount the possibility that these remains are from beef, pork, or mutton on the bone issued as rations. Isaac Hite notes occasionally issuing beef as "Provision[s] for Walker's servants" (presumably people enslaved by his son Walker Murray Hite) in February, March, October, and November 1836 (I. Hite 1847). This seems to be around the times of year that cattle were butchered at Belle Grove (I. Hite 1859), so fresh meat on the bone may have occasionally been issued to those living at Quarter Site B. However, chicken bones and both hatched and unhatched chicken eggshells have been recovered from the site, indicating that enslaved people raised chickens and ate chicken eggs (Figure 22). In her analysis of 375 eggshell fragments from the root cellar, Katelyn Bajorek identified hatched and unhatched duck eggshells and hatched guinea fowl eggs, indicating that a broader assortment of poultry was raised at

Figure 22. Poultry bones from Quarter Site B.

Quarter Site B. Goose bones, unhatched goose eggs, turkey bones, and possible unhatched turkey eggs have also been identified, but with the limited data, we cannot tell if enslaved people at Belle Grove raised geese and/or turkeys, or if they hunted wild birds and gathered eggs from wild nests.

The small mammal and amphibian bones, however, provide more definitive evidence of enslaved people hunting, which was common throughout the South (e.g., McKee 1999; Young et al. 2001). Scott Oliver has identified squirrel, rabbit, turtle, frogs/toad, and opossum bones in his preliminary analysis of the root cellar's faunal remains (Forth.). He also identified a deer bone from one of the excavated middens. Combined, these suggest that enslaved people hunted for
food, either using traps or guns, as we recovered four pieces of lead shot and 17 gunflint fragments from Quarter Site B. Oliver also identified fish bones and we found a fishhook at the site. Cedar Creek, Mill Brook, and the North Fork of the Shenandoah River are all nearby, and enslaved people could have fished in any of these.

Tending gardens, tossing feed to chickens, and hunting squirrels were acts that creatively assembled people and their needs and desires with plants, animals, soil nutrients, and landscapes (e.g., Carney 2017; 2020; Loichot 2007, 149; Walker 1983, 241; Wynter 1971). These assemblages brought together past, present, and future in novel ways (Reese 2019), linking saved seeds, memories of past meals, and the knowledge of where chickasaw plum trees are with actions done in what little time enslaved people had to themselves in hope of a soon-to-be-full stomach or to be able to enjoy a juicy plum after a winter without fresh fruit. Enslaved kinship emerged in and through mutual-aid networks, with family members defined in part by who contributed to, and who could lay claim on, shared food (Behrens 2010, 477; Haymes 2018, 3637; Penningroth 2003), so tending gardens and gathering walnuts brought together enslaved Shenandoahans (also see White 2020).

Calculated hunger from insufficient rations was an important part of these assemblages, but it did not dictate their contours. Enslaved women may not have needed to water gardens before leaving for the fields or pull weeds from them when they returned if their enslavers provided them with adequate food, but they might have (Walker 1983, 241). Instead, we might say that inadequate rations made it more likely that enslaved people would use the little time they had to themselves to plant gardens or hunt because these actions redressed the gastronomic violence imposed on them. This enacted an ontological counter-politics, a way for enslaved people to define their humanities on their own terms, to state that they were people who needed
more than a peck of cornmeal and a few pounds of salted pork per week. These ways of being human emerged through and were narrated by multi-species assemblages (T. L. King 2019, 140). Planting extra corn and gathering chickasaw plums were ways for enslaved Shenandoahans to define themselves as people who needed more food. Growing sorghum, rye, and (sweet) potatoes, raising chickens, and hunting deer, rabbits, squirrels, turtles, and frogs - all lean meats - undermined the argument that corn and fatty pork alone satisfied their biological needs.

Deciding who got how much of which food within kin groups based on anything other than age and gender rejected the logics of fungibility enslavers used to allot food. Redressing hunger did not remove enslaved people from the gastronomic violence imposed on them (Hartman 1997, 77). But it did reassemble it, creating new ways of being human that better aligned with enslaved people's needs and desires. An exhausting way of being human that required working at night and on Sundays, but one that promised a full stomach and the ability to eat something other than corn and salted pork.

It is important to note that not all enslaved people were able to feed themselves. Some, like Frederick Douglass, lacked access to the necessary connections to start a garden or a flock of chickens. Not everyone had the time or energy to hunt or gather wild plants. Enslaved people who were frequently hired out and rarely spent more than a year in the same place, which was the case for many enslaved Shenandoahans, were at a severe disadvantage (L. A. Lee 2016, 119; Simmons and Sorrells 2000). Seeds are easily transportable. Live ducks, and knowing where to find the most productive walnut trees are not (Bowes 2011). While the logic of liberal humanism's Man2 would argue that those unable to garden or hunt were incorrectly or insufficiently human (see Chapter 3), we must see these experiences as creating ways of being human that existed in the gap between enslavers' use of food to define the enslaved as differently
human and enslaved people's use of gardens and chickens to redefine their humanities (Weheliye 2014; Wynter 2003; 2015). Unfortunately, we lack data that address these forms of enslaved humanity in the Valley, like formerly enslaved people talking in more detail about the lack of food or excavations of enslaved peoples' living spaces on farms that routinely hired enslaved farmers. Until we have these, we must at least remember that the experiences of those unable to sate the gnawing hunger that shaped enslaved life matter just as much as those who were lucky enough to get food.

## Captured Redress

Some enslavers did not like enslaved people acquiring food on their own, as they "work[ed] their crop on the sabbaths" and at "nights when they should be at rest," and could easily incorporate stolen food into their stores (Tattler 1851, 41; J. H. Turner 1842, 129). But most encouraged enslaved people to produce their own food. Steven Stoll's (2017) concept of "captured gardens" helps to theorize this. Briefly, Appalachian coal companies did not pay miners enough for their families to survive on store-bought foods, forcing miners' wives and children to maintain garden plots. Companies then used the gardens as an excuse to keep wages low, since miners no longer needed extra money to feed their families. Or, as Stoll puts it, companies "captured" the labor families put into their gardens to increase profit margins. This same hopeless cycle repeats in how enslavers recommended capturing the labor enslaved people put into redressing the hunger imposed on them.
"Besides the food furnished by me," wrote J. Pauling (1836, 182, my emphasis), "nearly all the servants... make some addition from their private stores; and there is... hardly an instance of one so improvident as not to do it." In other words, enslaved people's efforts to provide food for themselves could be captured and used to increase profit margins since
enslavers knew that enslaved women and men would get extra food for themselves if given the opportunity (Neiman 2008, 170; Pulsipher 1990; Wynter 1971, 99; A. L. Young 1997, 32). Enslavers also captured the time enslaved people put into their gardens, since spending their "evenings and holydays... working" to get food meant less time for potentially seditious activities like drinking, singing, or dancing (Hill Edwards 2017, 778-79; Pauling 1836, 182; also see Barton and Cramer 1826; Harper 1834). Others reasoned that encouraging enslaved people to produce their own food created "an interest in" their "home" that kept them from seeking their freedom, since "no negro with a well stocked poultry house, [and] a small crop advancing... which he calculates soon to enjoy, will ever run away" (R. King 1829, 346; J. H. Turner 1842, 129; also see Virginia Free Press 1835).

Capturing these acts of redress also perpetuated enslavers' definition of the enslaved as people who could subsist on meager amounts of cornmeal and salted pork. Again, this was not enough food so many enslaved people grew, gathered, raised, and hunted in what little time they had. Enslavers captured this sated hunger, using it as evidence that issued rations were adequate (A Virginian 1849; Gooch 1833, 139). We can see this in Pauling's work, where three pages before declaring it "improvident" for enslaved people not to supplement their rations he insisted that "the slave is entitled to an abundance of good plain food" (Pauling 1836, 180, 183). But if these women and men ended up getting an abundance of food, it could not have been from their rations, or they would not have needed to contribute food from their "personal stores." Logical slippages like this are what allowed enslavers to define Black Southerners as differently human and to deny the hunger imposed on them.

Augusta County enslaver Henry Jones considered it "a good custom to... allow" enslaved people "to cultivate an acre or two of corn" for their own (Simmons and Sorrells 2000, 177),
while the Hites encouraged enslaved people at Belle Grove to raise poultry (see below). In Rockingham County, Jenny Buchannan (Still 1872a) recalled that her enslaver "allowed his slaves" the "privilege" of "rais[ing] fowl and hogs," although after he died, her next enslaver "stopped all hands from raising chickens, pigs, etc. He don't like to see them hold up their heads above their shoulders." This suggests that Valley enslavers implemented the recommended ways of capturing the work enslaved people put into redressing the hunger brought on by inadequate rations. Therefore, the extraordinary things enslaved Shenandoahans did to provide enough food for themselves and their families, and to redefine themselves as people who could not survive on cornmeal and salted pork alone, did not produce resistive effects that ate away at the institution of slavery (contra McKee 1999; Twitty 2017, 269). Bringing chickens and gardens into enslaving assemblages reterritorialized them and recoded how existing components interacted, creating "shoals" that disrupted how enslavers' definitions of enslaved people's humanities circulated throughout the Valley (T. L. King 2019). But the ontological plasticity of these assemblages and the forms of humanity they generated ensured that the broad contours of enslaving assemblages continued to be recited (Z. I. Jackson 2020, 10; also see Hartman 1997). Enslavers reterritorialized and recoded acts that redressed hunger, finding new handholds amid the frictions introduced by enslaved people to perversely transform the multi-species assemblages that redress hunger into practices that also reproduced slavery.

## Extra Food

Enslaved people put tremendous effort into feeding themselves and their families. While they could only garden, hunt, fish, gather wild plants, and tend to their poultry at night or on Sundays, many acquired more food than they needed. When this happened, they often sold their surplus to their enslavers, local merchants, or other White people, which was common practice in

Table 8. Enslaver's estimates of the amount and value of food grown, gathered, and hunted by people enslaved on his Virginia farm in eastern Virginia, 1837. Data from Galen (1837).

Virginia (e.g., Heath 2004; Samford 2004; Schlotterbeck 1991). Enslavers noted that this was an important source of money for enslaved Virginians. One enslaver calculated the total value of the food grown, gathered, and hunted by enslaved people at his Virginia farm to be at least $\$ 73.50$ in 1837 (\$1,994 in 2020, Table 8), but another suggested that enslaved people ate most of this, selling only $\$ 5$ to $\$ 30$ worth of produce a year (Galen 1837, 577; Pauling 1836, 181). The ability to sell food depended on their families' needs and enslaved people with younger children were less likely to have extra food (Heath 2004).

When enslaved Shenandoahans managed to sell food, they impacted the local economy. Edward Sperry, a merchant in Middletown, bought $\$ 355.12$ worth of corn and pork from enslaved Shenandoahans in 1838 (\$9,937 in 2020) (Sperry 1839). This only made up $1 \%$ of all the foodstuffs Sperry bought, but enslaved people sold $23.7 \%$ of the corn he purchased while making up $22.6 \%$ of the 53 corn sellers. ${ }^{61}$ In other words, enslaved people could make the same types of contributions to the local economy as White farmers when selling corn.

[^49]Table 9. Poultry Bought by Isaac Hite, 1835. Data from (I. Hite 1847, 192).

| 10 May 1835 | Old Frank | 12 Chickens | ¢78 |
| :---: | :---: | :---: | :---: |

|  | Not Listed | 4 Ducks | ¢80 |
|  | Not Listed | 1 Tray | ¢33.66 |

Enslaved people at Belle Grove may have sold some of the corn they grew. Valley merchants also bought potatoes, sweet potatoes, venison, and rabbit meat (e.g., Milton 1849; Griffith 1862; Sperry 1839), any of which the inhabitants of Quarter Site B could have sold. The best evidence we have for enslaved people selling extra food comes from poultry. Archival records show that the Hites bought chickens, ducks, and "trays" from the women and men they enslaved (Table 9). The faunal remains also indicate that the enslaved inhabitants of Quarter Site B sold poultry. Katelynn Bajorek (In Press) identified a variety of eggshells from the root cellar (Feature 3), with the most common species being chicken and duck (Table 10). Most of the chicken and duck shells are hatched ( $68.18 \%$ and $71.84 \%$, respectively), indicating that while enslaved people cooked and ate eggs to deal with the limited rations issued to them, most of the eggs were either sold or hatched so they could be raised for meat (Lamzik 2013; L. A. Lee 2016)..$^{62}$ Scott Oliver has identified multiple chicken bones in the root cellar fill, but he has not identified any duck bones. In 1835 the Hites paid enslaved people $\$ 0.20$ for whole ducks and only $\$ 0.065$ for whole chickens (\$5.88 and $\$ 2.06$ in 2020, respectively). And in 1850 the Homer and Nelson Store in Back Creek paid $\$ 0.16$ for whole ducks and $\$ 0.125$ for whole

[^50]Table 10. Results of eggshell analysis from Early Root Cellar (Feature 3). Data from Bajorek (In Press).

| Species | Hatched | Not Hatched | Indeterminate | Total |
| :--- | :---: | :---: | :---: | :---: |
| Chicken | 45 | 19 | 2 | 66 |
| Chicken or Turkey | 1 | 0 | 0 | 1 |
| Duck | 199 | 77 | 1 | 277 |
| Duck or Turkey | 1 | 1 | 4 | 6 |
| Turkey | 0 | 5 | 0 | 5 |
| Goose | 0 | 1 | 0 | 1 |
| Goose or Guinea Fowl | 3 | 1 | 0 | 4 |
| Guinea Fowl | 2 | 6 | 0 | 8 |
| Indeterminate | 1 | 5 | 1 | 7 | chickens ( $\$ 5.31$ and $\$ 4.31$ in 2020, respectively) (Homer and Nelson 1851, 185, 260). ${ }^{63}$ Based on this it seems that enslaved people at Quarter site B ate chickens more often than the highervalue ducks, preferring to sell the latter when they could avoid eating them. Selling extra food was not the only way enslaved Shenandoahans participated in the local economy. Some sold rags and firewood, or homemade baskets and brooms (Milton 1849, 240; Gore 1860, 117; Griffith 1862, 1860:4; Page News \& Courier 1932). Others, including Betty, Nancy, and Truelove at Belle Grove, worked at night for their enslavers (I. Hite 1847, 175-76). Still others practiced various trades in their off hours (Milton 1849, 15; Southern Claims Commission 1878). But selling extra food was the most common way enslaved Shenandoahan seemed to have made money, with foodstuff accounting for $90 \%$ of the items enslaved people sold in the merchants' ledgers used in this study (also see A. S. Martin 2008, 174). In other words, the multi-species assemblages mobilized to sate hunger and redefine enslaved humanities contributed to enslaved people's ability to participate in local economies. This is not to argue that hunger and the need to redress it were the sole causes of enslaved people's participation in local economies, but rather that to stress that hunger was an important part of these assemblages. Without hunger and

[^51]attempts to redress it, the actions of enslaved consumers discussed in Chapters 7, 8, and 9 would have played out differently.

## Chapter 7: Cities, Towns, and Country Stores

After 26 years of being enslaved, John Spratley sought his freedom from Frederick County in July 1819 (M. Cartmell 1821). We know little about Spratley's life before 1819 aside from the fact that he was literate, "tolerably well informed," and, despite being enslaved "five miles" southwest of Winchester, he was "well known" in the city, "having attended market there for nearly three years" (Figure 23). Spratley's routine excursions to Winchester highlight our need to focus on the trips enslaved Shenandoahans made to sell, buy, and trade for commodities, and how these travels shaped enslaved life, providing connections and information that may have helped Spratley in his bid for freedom.

Archaeologists routinely study enslaved people's consumption practices (e.g., Bates 2016; 2017; Farnsworth 1996; Galke 2009; Galle 2010; 2011; 2017; Gibson and Kelly 2019; Heath 1999; Reeves 2015a; Samford 2007; Schweickart 2019; Symanski 2012; Wilkie 2000b; Wilkie and Farnsworth 1999; 2005). Yet our efforts often remain "single-sited," unable to, or uninterested in, locating our work in the plantations where we dig up consumer goods and in the commercial venues commodities came from (Hauser 2008, 67). As Mark Hauser (2007, 292-93; $2008,67)$ argues, we need multi-sited research that includes "set-apart places like" quartering sites "and market[s]" (also see C. R. Cobb and DePratter 2012; Hauser 2009a; Marcus 1998; Ryzewski 2012). Several studies have traveled with enslaved people to cities, towns, and country stores to study the social dynamics that played out in these places (e.g., Bloch and Agbe-Davies 2017; Hauser 2007; 2009b; 2011; Heath 2004; Schwalbe 2020; Samford 2004). But they have not addressed how the power wielded by enslavers affected consumption practices, largely

Figure 23. Winchester market house frequented by John Spratley, c. 1864. Image from Taylor (1989, 163).
because these studies treat restrictions on enslaved people's ability to sell, buy, and trade for commodities as background information and not something we can systematically assess with archaeological data (e.g., Hauser 2008; L. A. Lee 2012; 2016; 2017). I only know of two exceptions to this: Theresa Singleton's (2015b, 146, 180-81) suggestion that a large wall surrounding a Cuban quartering site limited enslaved people's ability "to engage in trade," possibly explaining a paucity of consumer goods found at the site, and Kevin Fogel's (2019) study of how enslaved consumers in South Carolina overcame restrictions enslaved placed on them. If we want to keep mapping out the poetics of enslaved people's consumption practices, we need to do a better job of addressing how restrictions affected enslaved people's ability to acquire commodities (Singleton 2015b, 148).

This chapter uses ceramics and merchants' ledgers to show that enslaved Shenandoahans' access to cities, towns, and country stores became increasingly restricted throughout the $19^{\text {th }}$ century. Specifically, we see that over time, enslaved people made up a smaller percentage of the customers in the ledgers, acquired imported ceramics less often, and bought locally-made vessels at fewer places. This fits with historical documents that show enslavers increasingly worrying
about and trying to control enslaved people's consumption practices, suggesting that restrictions on enslaved Shenandoahans' ability to travel to cities, towns, and country stores affected their ability to acquire consumer goods.

Recognizing this is important for rethinking slavery in the Shenandoah Valley. Like the archaeological studies Hauser critiques, histories of Valley slavery are generally single-sited, focusing on the properties where Shenandoahans were enslaved (e.g., Keller 2000; Koons 2000a; Simmons 1997; Simmons and Sorrells 2000). The few works that look beyond these estates focus on enslavers instead of the enslaved (but see Noyalas 2021). As a result, they create rigid borders that demarcate sites of slavery (plantations, farmsteads, etc.). But such hard and fast boundaries like this never existed except in the imaginations of enslavers, who consider their farmsteads and plantations to be self-contained and self-sufficient (Glissant 1997, 67). People, animals, and things constantly moved through these ever-porous boundaries (e.g., Baker 1810; Baylor 1833; Beeler 1818; H. T. M. Briscoe 1833; I. Hite 1817a; 1817b; W. Lee 1832), and not talking about these movements reiterates enslavers' fantasies instead of attending to the historical realities of Valley slavery. This is especially important when thinking about how enslaving assemblages came to repeat in the Valley, because these did not just rely on interactions between people, things, and discourses within plantations, but also on the actions of (often non-enslaving) White Shenandoahans living elsewhere.

## "Passing the Day... In Intemperance and Immorality"

Acquiring commodities from cities, towns, and country stores allowed enslaved people to build lives for themselves. Enslavers knew this and were deeply ambivalent about these practices (e.g., Gooch 1833; Hill Edwards 2021; K. M. Hilliard 2014; Pauling 1836; Southern Planter 1856; J. H. Turner 1842; Winchester Republican 1831; Virginia Free Press 1835). On the one
hand, enslavers tried to reassemble enslaved people's needs and desires for consumer goods with practices and discourses that could perpetuate slavery (Hill Edwards 2021; K. M. Hilliard 2014). On the other hand, enslaved people could reterritorialize and recode these carefully ordered compositions, altering how enslaving assemblages repeated across time and space. As a result, enslavers saw regulating enslaved people's access to cities, towns, and country stores as a struggle to create order from the (potentially) chaotic effects of enslaved people's consumption practices (also see Hauser 2008, 39-66; Hill Edwards 2021, 31, 158, 160; Lockley 2000, 33; Olwell 1996). And the ontological politics of enslaved life created the grounds upon which this struggle was waged.

Enslaving assemblages operated, in part, by continually arranging and rearranging Black women, children, and men to perpetuate the power and profit of slavery, which we have discussed before as fungibility (Hartman 1997; T. L. King 2016; 2019; Snorton 2017; Omolade 1983; Spillers 1987). Tiffany King (2019) and Sylvia Wynter (1984) argue that this constant (re)assembling of Black flesh (sensu Spillers 1987) to serve White interests led enslavers to see Blackness as chaotic and unstable. Riley Snorton (2017) further argues that this constant shifting and rearranging created an ever-present potential for enslaved people to exploit gaps in enslaving assemblages (Glissant 1997, 138-39). For enslavers, this meant that enslaved people could, at any time, decompose the carefully arranged political economies of slavery (T. L. King 2019). By contrast, enslavers saw themselves as inhabiting a rational way of being human, a homo rationalius that they performatively enacted by ordering the perceived disorder of Blackness, reterritorializing and recoding the lives of enslaved people to perpetuate enslaving assemblages (Kennedy 1853, 310; T. L. King 2019, 108-10; Wynter 2003; also see Dawdy 2008, 9; Reilly 2016). This meant that enslavers' anxieties about the disruptive effects of enslaved people's
participation in local economies were not just concerns over consumption practices, but an ontological politics waged over the definition of White and enslaved humanities.

These struggles started in Virginia in the $18^{\text {th }}$ century, but our first sign of how they may have operated in the Shenandoah Valley comes from a 1792 state law that criminalized "buy[ing] or sell[ing]... any commodity" from/to enslaved people without their enslaver's consent (Guild 1969, 66). White Virginians who did so had to pay the enslaver "four times the value of the thing bought or sold" and were either fined \$20 (\$539 in 2020) or received 39 lashes on their "bare back." Valley enslavers eagerly took to the law, running advertisements in newspapers informing the public that they would not give consent to anyone "dealing with" the women and men they enslaved as early as 1808 (S. Thompson 1808). In 1810-1818, 11 bans were published in the Farmers' Repository (Baker 1810; Beeler 1818; Brinton 1816; Bryan 1811; Dandridge 1817; T. Davenport 1812; Gibbons 1816; Hammond 1810; W. Lee 1813; G. Moore 1817; H. S. Turner 1810). Some bans targeted specific enslaved people (Conrad 1820; Heterick 1820; S. Thompson 1808), or the sale of alcohol (Hammond 1810), but most applied to anything bought or sold by everyone the advertiser enslaved. These were not idle threats. In 1809, four prominent Jefferson County men were charged with buying fish and potatoes from Joshua, a man enslaved by Nathaniel Craghil (G. Hite 1809). The reasons for these bans are rarely mentioned but some were clearly punishments, as one was enacted because enslaved people were selling "fruit and vegetables, but especially Asparagus from my garden... to certain persons in Charles-town" (W. Lee 1813). However, another was issued during a dispute over the ownership of a group of enslaved people (Henry 1826; H. Vanmeter 1826; S. Vanmeter 1826), with the bans being a way for two enslavers to exert their claim to the enslaved people in question. We can see these bans as enslavers perversely reterritorializing/recoding enslaved people's consumption practices,
turning these into actions that reproduced slavery. By enforcing these bans, enslavers coerced merchants and other White Shenandoahans into acting in certain ways that allowed enslaving assemblages to repeat across time and space.

From what I can tell, White Shenandoahans did not explicitly define enslaved people's consumption practices as chaotic until the 1820s. In 1822 Winchester introduced new laws for "the preservation of good order on the Sabbath, and for the suppression of other disorderly conduct of Slaves," which criminalized enslaved people "profan[ing] the Sabbath" and "loiter[ing]" near "Tiping [sic] Houses, or other disorderly Houses" after 10 p.m. (Winchester Gazette 1822). However, this did not assuage enslaver's concerns about the disorderly effects of enslaved people's consumption practices, as four years later the Agricultural Society of the Valley complained about enslaved people "visiting Winchester on the Sabbath and passing the day (unknown to their masters) in intemperance and immorality" (Barton and Cramer 1826).

Concerns about enslaved people's consumption practices increased in the 1830s and 1840s. Agricultural journals that circulated in the Valley routinely printed condemnations of enslaved people stealing (Gooch 1833), drinking (American Farmer 1839a; Harper 1834; M 1839; R 1840), and, most scandalously, selling stolen goods to buy alcohol (Archer 1842; Dumpling 1842; Farmers' Register 1842; W. H. Harrison 1840). These sentiments led the state legislature to criminalize enslaved people selling alcohol "near any public assembly" and White Virginians "knowingly receiv[ing]" stolen goods from enslaved people in 1832 (Guild 1969, 108). Two years later, enslaved people were banned from peddling "goods... without a license" (Guild 1969, 109). In 1848, selling "ardent spirits" to enslaved people "without consent of the[ir] master" became illegal with guilty parties fined up to $\$ 50$ for their first offense ( $\$ 1,638$ in 2020)
(Guild 1969, 166-67). Enslavers who let enslaved people buy alcohol for resale also faced fines (Guild 1969, 167).

I only found two documents showing Valley enslavers actively participating in these discourses: a complaint about enslaved people selling "pillow cases, sheets, linen, \&c." to "grogshops" in Winchester (Winchester Virginian 1830), and a request from Jane Washington (1841) that "constables and other officers... arrest" anyone she enslaved who was "found in Charleston, without a pass." However, new laws passed in the 1850s suggest that concerns about enslaved people's chaotic consumption practices increased throughout the 1830s and 1840s. In 1856 Winchester revised its city ordinances, limiting where enslaved vendors could sell their goods and completely banning enslaved people from buying or selling alcohol within city limits (Common Council 1856, 67, 79). The 1822 prohibition on enslaved people "loitering in or about... disorderly Houses" after 10 p.m. was also expanded to include enslaved people being anywhere outside of their enslaver's dwelling or shop (Common Council 1856, 83-84;

Winchester Gazette 1822). Constables who did not enforce this law faced fines. Charlestown and Shepherdstown (Jefferson County) passed similar curfews in 1851 and 1855 (respectively) (Shepherdstown Register 1855a; Spirit of Jefferson 1851). And in 1853 Jefferson County made selling alcohol to enslaved people illegal without their enslaver's "written consent," with guilty parties forced to pay the enslaver "four times the value" of the alcohol (Spirit of Jefferson 1853a).

This suggests that Valley enslavers increasingly saw Blackness as chaotic and disorderly, especially at night or when combined with alcohol. To ensure that this perceived chaos did not disrupt the repetition of enslaving assemblages, and to performatively define themselves as rational humans capable of mastering the world around them, enslavers attempted to order this
perceived chaos by restricting enslaved people's consumption practices. Similar restrictions on White Shenandoahans loitering in Winchester or on the sale/consumption of alcohol to/by White men were never passed (e.g., Common Council 1856), indicating that enslavers viewed this potential chaos as something tied to Blackness. Furthermore, Valley enslavers were not just following state-wide trends but actively participating in broader discourses on how to manage Blackness, as Winchester banned all sales of alcohol to enslaved people before the state legislature did so in 1860 (Guild 1969, 169). White Shenandoahans even petitioned the state legislature in 1860 to criminalize the "immoral practice" of enslaved people owning and raising pigs, since enslaved Shenandoahans were (supposedly) stealing food to feed these animals, and this supply of meat made it "impossible... to prove that bacon found in their possession is stolen property" (Noyalas 2021, 26-27). To enact these restrictions, enslavers continued to bring nonenslavers into enslaving assemblages, threatening merchants, tavern owners, and city constables with financial ruin if they sold a pint of whiskey to an enslaved man or did not jail an enslaved woman hurrying home five minutes after curfew. To see how this affected enslaved life in the Shenandoah Valley we need to historicize trends in enslaved people's consumption practices to see if they map onto this narrative of increased restrictions throughout the $19^{\text {th }}$ century.

## Merchants' Ledgers

Through the scrawled entries [in merchants'ledgers], images of people on the move emerge crossing streams, riding down mountain passes, walking down the streets and roads, alone or in groups.
(A. S. Martin 2008, 69)

Merchants kept fastidious records of the things they bought and sold, providing intimate windows into the activities that took place within stores (Fennell 2017; K. M. Hilliard 2014; A. S. Martin 2008). Some Valley merchants kept separate books for Black customers (e.g., Frame
1812), but many included enslaved people in their main ledgers. ${ }^{64}$ Most enslaved people did not have their own accounts but bought and sold things on the accounts of White Shenandoahans (Heath 2004, 27-28). However, we can distinguish things bought/sold by enslaved people from those bought/sold by the account holder (A. S. Martin 2008, 69). For instance, when Joseph Davis bought coffee on his account at the Homer and Nelson Store in Back Creek (Frederick County), the ledger says "Joseph Davis, per self" (e.g., Homer and Nelson 1851, 28). When Davis's wife bought sugar on his account, it says "Joseph Davis, per wife" (Homer and Nelson 1851, 158). And when an enslaved man bought nails and salt for himself on this account, the ledger says "Joseph Davis, per boy" (Homer and Nelson 1851, 40, 53). When enslaved people picked up items at stores for their enslavers it was noted as "per self" followed by a note that an enslaved person made the transaction, indicating that entries stating "per boy" or something to that effect are instances of enslaved people buying commodities for themselves (also see Heath 2004; A. S. Martin 2008).

All this is to say that we can use entries in Valley ledgers to trace out enslaved people's consumption practices. To do this I looked at 12 ledgers, the 1795 and 1796-1797 ledgers from an unnamed store in Charlestown (Account Book 1 1795; Account Book 2 1797); the 1799-1800 ledger from an unnamed store in Winchester (Account Book 1800); the 1806 ledger from an unnamed store in Middletown (Account Book 1806); the 1838-1839 ledger from Edward Sperry's Middletown store (Sperry 1839) (Figure 24); the 1841-1842 ledger from Clark Cather's Winchester store (Cather 1882); ${ }^{65}$ the 1842-1849 ledger from an unknown store in Winchester

[^52]

Figure 24. Sketch of Main Street, Middletown, c. 1864. Edward Sperry's store is depicted on the left. Image from Taylor (1989, 126).
that relocated to Strasburg in 1845 (Milton 1849); ${ }^{66}$ the 1849-1851 and 1856-1858 ledgers for Homer and Nelson's Back Creek store (Homer and Nelson 1851; 1858); the 1858-1860 ledger for Mahone Gore's Back Creek store (Gore 1860); the 1860-1861 ledger for the Baker Store in Mount Olive (Baker Store 1861); and the 1860-1862 ledger from James Griffith's White Hall store (Griffith 1862). From these, I transcribed 531 transactions involving enslaved people
(Appendix E, Table 1). ${ }^{67}$ I identified enslaved consumers as people listed as "boy," "girl," "negro," "black," and/or something like "Page’s Martin" while buying or selling items on another person's account. ${ }^{68}$ I considered account holders to be free (either White or Free Black) unless other information suggested that they were enslaved.

[^53]Table 11. Merchants' ledgers used in this study.

| Ledger | Location | All <br> Transactions | Enslaved <br> Transactions | Percent <br> Enslaved |
| :--- | :--- | :--- | :---: | :---: |
| Charlestown 1795 | Charlestown, Jefferson County | 2169 | 57 | $2.62 \%$ |
| Charlestown 1799-1797 | Charlestown, Jefferson County | 4229 | 199 | $4.70 \%$ |
| Winchester 1799-1800 | Winchester, Frederick County | 1695 | 73 | $4.30 \%$ |
| Middletown 1806 | Middletown, Frederick County | 777 | 9 | $1.15 \%$ |
| Edward Sperry 1838-1839 | Middletown, Frederick County | 593 | 17 | $2.86 \%$ |
| Clark Cather 1841-1842 | Winchester, Frederick County | 983 | 10 | $1.01 \%$ |
| Winchester 1842-1845 | Winchester, Frederick County | 462 | 15 | $3.24 \%$ |
| Strasburg 1845-1849 | Strasburg, Frederick County | 5473 | 81 | $1.47 \%$ |
| Homer and Nelson, 1849-1851 | Back Creek, Frederick County | 3850 | 4 | $0.10 \%$ |
| Homer and Nelson, 1856-1858 | Back Creek, Frederick County | 3095 | 15 | $0.48 \%$ |
| Mahone Gore, 1858-1860 | Back Creek, Frederick County | 3090 | 8 | $0.25 \%$ |
| Baker Store, 1860-1861 | Mt. Olive, Shenandoah County | 1416 | 5 | $0.35 \%$ |
| James Griffith, 1860-1862 | White Hall, Frederick County | 2998 | 38 | $1.26 \%$ |

The earlier ledgers (1795-1806) contain 338 transactions by enslaved people, which make up $3.81 \%$ of all transactions in these books $(\mathrm{n}=8,870)$ (Table 11). We do see variation within these ledgers, with a higher percentage of enslaved customers in Winchester (4.30\%) and Charlestown (4.00\%) than in Middletown (1.15\%). Middletown was relatively small, with only 34 households in 1810 (US Bureau of the Census 1810a). Three of the five accounts enslaved people used belong to men living in or near Middletown, suggesting that enslaved people who bought goods there were usually enslaved nearby. Meanwhile, the larger percentage of enslaved people in Charlestown and Winchester suggests that they predominantly went to larger municipalities to trade.

The later ledgers (1838-1862) contain 193 transactions by enslaved people, which make up $0.87 \%$ of all transactions in these books $(\mathrm{n}=21,960)$. Again, there are variations between the ledgers, and these can be broadly grouped by location. Winchester has the highest percentage of enslaved consumers (1.73\%), although there are differences between the two Winchester ledgers, with a higher percentage of enslaved customers at the unnamed store (3.24\%) than Cather's store

Table 12. Transactions involving enslaved people, by day of the week. The general lack of transactions on Sunday is a result of these stores rarely doing business on Sundays.

| Ledgers | Monday | Tuesday | Wednesday | Thursday | Friday | Saturday | Sunday |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Winchester 1799-1800 ( $\mathrm{n}=73$ ) | $16.44 \%$ | $17.81 \%$ | $15.07 \%$ | $19.18 \%$ | $13.70 \%$ | $17.81 \%$ | $0.00 \%$ |
| Charlestown 1795-1797 ( $\mathrm{n}=256$ ) | $16.80 \%$ | $14.84 \%$ | $21.48 \%$ | $13.67 \%$ | $15.63 \%$ | $16.80 \%$ | $0.78 \%$ |
| Winchester 1841-1845 ( $\mathrm{n}=25)$ | $4.00 \%$ | $20.00 \%$ | $24.00 \%$ | $28.00 \%$ | $16.00 \%$ | $8.00 \%$ | $0.00 \%$ |
| Strasburg 1845-1849 ( $\mathrm{n}=81)$ | $11.11 \%$ | $14.81 \%$ | $12.35 \%$ | $9.88 \%$ | $12.35 \%$ | $39.51 \%$ | $0.00 \%$ |
| Middletown 1838-1839 ( $\mathrm{n}=17)$ | $0.00 \%$ | $0.00 \%$ | $5.88 \%$ | $64.71 \%$ | $11.76 \%$ | $17.65 \%$ | $0.00 \%$ |
| Back Creek 1849-1860 ( $\mathrm{n}=27)$ | $11.11 \%$ | $11.11 \%$ | $3.70 \%$ | $25.93 \%$ | $22.22 \%$ | $25.93 \%$ | $0.00 \%$ |
| White Hall 1860-1862 ( $\mathrm{n}=38)$ | $26.32 \%$ | $13.16 \%$ | $7.89 \%$ | $15.79 \%$ | $18.42 \%$ | $18.42 \%$ | $0.00 \%$ |

(1.01\%). Enslaved people make up $1.47 \%$ of transactions in the market town of Strasburg. Finally, country stores have the smallest percentage of enslaved customers, who account for $0.026 \%$ of transactions in Back Creek, $0.035 \%$ in Mount Olive, and $1.26 \%$ in White Hall. Sperry's ledger is an outlier, with enslaved people conducting $2.86 \%$ of transactions. However, all 17 transactions involve the sale of corn and pork, probably because people enslaved near Middletown sold these bulky items locally instead of hauling them to stores further away.

There are two major trends in this data. First, enslaved people appear less frequently in the later ledgers, decreasing from $4.30 \%$ to $1.73 \%$ of transactions in Winchester, $4.00 \%$ to $1.42 \%$ in market towns, and $1.15 \%$ to $0.047 \%$ in small towns and country stores. Between 1800 and 1850, the percentage of enslaved people in the northern Valley increased from $17.20 \%$ to $20.16 \%$, so demographic shifts cannot explain this trend (see Figure 2). Winchester is the only location included in the early and later ledgers, and stores from the 1840s show a drop in the percentage of enslaved transactions suggesting that this trend is not (solely) because different towns are included in the datasets. Therefore, the decreased presence of enslaved consumers in local ledgers is a meaningful trend that tells us something about enslaved life in the Valley. Several factors are probably involved here, but enslavers increasingly regulating enslaved people's consumption practices are contributing to this trend.

We can see this by looking at the days of the week enslaved people show up in the ledgers. In the earlier ledgers from Winchester and Charlestown, transactions involving enslaved people occur throughout the week except for a slight increase in Charlestown on Wednesdays (Table 12). Enslaved people's transactions in the later ledgers, however, are not as spaced out, with $52 \%$ of Winchester transactions occurring on Wednesdays and Thursdays, and $39.51 \%$ of transactions in Strasburg happening on Saturdays. The later ledgers from Middletown, Back Creek, and White Hall also show enslaved people predominantly trading with merchants on a select few days. ${ }^{69}$ The Griffith ledger, which has the most regularly spaced out transactions of the post-1830 country stores, also has the highest percentage of enslaved transactions, suggesting that there is a correlation between when enslaved people could go to stores and the relative amount of enslaved customers. Enslaved people labored throughout the week, so unless they went to stores at night, people like Sam and Ambrose needed permission from their enslaver to sell corn at Sperry's store on Thursday 10 May 1838 (Sperry 1839, 7; also see K. M. Hilliard 2014,39 ). Enslaved consumers do not typically show up at the end of the entries for a particular day, suggesting that they were not primarily doing business at night. Therefore, choices enslavers made about when enslaved people could go to cities, towns, and country stores are part of the poetics of enslaved people's consumption practices. And by the 1830s, it seems that Valley enslavers gave this permission less often, contributing to the overall decrease in enslaved customers in the later ledgers.

The second trend is a higher percentage of enslaved people in ledgers from Winchester and market towns compared to smaller towns or country stores. We see this in both sets of ledgers. With biweekly markets and multiple stores, Winchester, Charlestown, and Strasburg

[^54]provided more options than small towns. They were also important places for people enslaved on disparate farms/plantations to socialize, allowing some, like John Spratly, to become "well known" (M. Cartmell 1821; Heath 2004, 28; Hill Edwards 2021, 28). Enslaved Shenandoahan's continued desire to go to market towns and Winchester - and to use these as places to build social lives beyond the narrow confines of the plantation - combined with discourses about Blackness-as-chaos to rub against enslavers' desire to narrate themselves as fully human homo rationalis by organizing the world in ways they understood to be orderly. This friction did not decompose enslaving assemblages but led enslavers to introduce new practices and discourses to ensure enslaving assemblages repeated in particular ways across time and space. These new components, in turn, made it harder for enslaved Shenandoahans to do some of the things that redressed their pain and suffering (sensu Hartman 1997) like buying castor oil in Back Creek for a sick child, acquiring sugar or molasses in Winchester to make up for never-quite-adequate food rations, or selling eggs and butter in Strasburg to be able to afford these things (Milton 1849, 12, 28, 260, 399; Homer and Nelson 1851, 66).

Just using ledgers to discuss this aspect of enslaved life in the Valley, however, is tenuous. Restricting enslaved people's ability to travel to, and trade with merchants in, cities, towns, and country stores meant criminalizing certain types of transactions (like buying alcohol). Since ledgers could be used as evidence in court cases (A. S. Martin 2008), illegal trading was not systematically recorded (K. M. Hilliard 2014, 77). We could use court documents to assess gaps in the ledgers, finding cases where merchants or peddlers were tried for illegally trading with enslaved people. But this only tells us about those (allegedly) caught doing illegal activities. Or, perhaps more productively, we could turn to archaeological materials, particularly the ceramics from Belle Grove's Quarter Site B.

## Imported Ceramics

The ceramics recovered from enslaved quartering sites predominantly came from enslaved people acquiring vessels on their own or getting them second-hand from their enslavers (e.g., Bloch and Agbe-Davies 2017, 126; Galle 2010; Singleton 2015b, 137). ${ }^{70}$ Peddlers operated throughout the Valley, providing Shenandoahans an alternative to traveling to towns or country stores to buy things like tin cups, shears, vests, and handkerchiefs (Beeman 1976; Pitman n.d., 912; Rainer 2000; Veney 1889,18 ). But we have no record of peddlers selling ceramics, probably because they were breakable, and carting them around might result in unsellable broken vessels. This means that ceramics enslaved people acquired on their own are traces (sensu Joyce 2006; Trouillot 1995) of their movements to cities, towns, and country stores since these are the only places where they could have gotten these items. To identify these traces at Quarter Site B we just need to determine which vessels enslaved people got on their own and which they got second-hand from the Hites. One way of doing this is comparing decorative motifs on imported vessels (predominantly porcelain and refined earthenware) from the manor house grounds and Quarter Site B, using the assumption that Quarter Site B vessels with motifs found at the manor house likely came second-hand from the manor house while vessels from Quarter Site B with motifs that do not overlap were probably acquired by enslaved people (also see Kelso 1997, 90).

Several areas around the manor house have been excavated, including Old Hall (Belle Grove's first manor house), several outbuildings, and workspaces associated with these structures. Three projects in particular - the 1972-1976 excavations of the grounds west of the

[^55]manor house (including Old Hall) (Paonessa 1995; Rockwell 1974), the 1984 mitigation-related investigations of the areas west of Old Hall (Verry 1984), and the 1994 excavations of a work area south of Old Hall (Geier 1995; Geier et al. 2008) - provide the most extensive ceramic collections from the manor house grounds, with 2,486 decorative sherds from imported ceramic vessels that likely pre-date 1860. Using a minimum vessel analysis, I identified at least 331 individual vessels from these collections (Appendix E, Table 2). With this completed, I grouped vessels with similar decorative patterns (likely part of the same set) into 272 vessel sets.

I performed the same analyses on the Quarter Site B ceramics, focusing on sherds from units in/around the four middens, the possible house sites southwest (Locus 2, Area 1) and northwest (Locus 2, Area 2) of the 2017-2019 project area, the early root cellar (Feature 3), and the later subfloor pit (Feature 24) and other contexts associated with the destruction of House Site 1 . Because sherds from different parts of the site are unlikely to be from the same vessel, I conducted separate minimum vessel counts for each area (Figure 25). ${ }^{71}$ Initial analyses suggested that ceramics from the two units in Midden 1's southwestern quadrant were different than the rest of the midden, so I further divided Midden 1 into Midden 1 Main and Midden 1 Southwest. I identified at least 283 vessels (Appendix E, Table 3), which I grouped into 125 vessel sets. Focusing on two types of refined earthenwares - pearlware and whiteware - provides the best way of historicizing comparisons between Quarter Site B and the manor house grounds, as pearlware pre-dates 1830 and whiteware post-dates 1820 , and $78.91 \%$ of vessels belong to these types. Of the 126 transfer-printed, hand-painted, and edge-decorated pearlware vessels from

[^56]

Figure 25. Units Included in each area for the minimum vessel analysis. Root cellar and subfloor pit features not shown.

Quarter Site B that could be placed into vessel sets, 46 (36.50\%) are from sets associated with the manor house (Appendix E, Table 4), suggesting that enslaved people at Belle Grove predominantly used pearlware vessels they got from cities, towns, and country stores. ${ }^{72}$ Vessels associated with the manor house are found throughout Quarter Site B, but they are not uniformly distributed across the site, suggesting not everyone had equal access to these ceramics and/or some enslaved people preferred acquiring their own vessels (Table 13). The whitewares, however, show a different trend. Of the 40 transfer-printed, hand-painted, and edge-decorated

[^57]Table 13. Vessels from different parts of Quarter Site B that belong to sets associated with the manor house ground.

| Pearlware Vessels from Sets Associated with the Manor House |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Midden 1 Main ( $\mathrm{n}=37$ ) | 5 (62.5\%) | 8 (53.33\%) | 4 (28.57\%) | 17 (45.94\%) |
| Midden 1 SW ( $\mathrm{n}=10$ ) | 1 (33.33) | 1 (25\%) | 0 (0\%) | 2 (20\%) |
| Midden 2 ( $\mathrm{n}=47$ ) | 4 (40\%) | 5 (29.41\%) | 8 (40\%) | 17 (36.17\%) |
| Midden 3 ( $\mathrm{n}=12$ ) | 2 (66.66\%) | 2 (66.66\%) | 1 (16.66\%) | 5 (41.66\%) |
| Midden 4 ( $\mathrm{n}=3$ ) | 1 (100\%) | n/a | 0 (0\%) | 1 (33\%) |
| Locus2 Area1 ( $\mathrm{n}=6$ ) | 1 (100\%) | 2 (66.66\%) | 0 (0\%) | 3 (50\%) |
| Locus2 Area2 ( $\mathrm{n}=3$ ) | 0 (0\%) | 1 (100\%) | 1 (50\%) | 2 (66.66\%) |
| Whiteware Vessels from Sets Associated with the Manor House |  |  |  |  |
| Area | Transfer-Printed | Hand-Painted | Edgeware | Total |
| Midden 1 Main ( $\mathrm{n}=9$ ) | 5 (55.55\%) | 2 (50\%) | 2 (100\%) | 9 (60\%) |
| Midden 1 SW ( $\mathrm{n}=2$ ) | 0 (0\%) | n/a | n/a | 0 (0\%) |
| Midden 2 ( $\mathrm{n}=17$ ) | 3 (42.85\%) | 5 (83.33\%) | 0 (0\%) | 8 (47.05\%) |
| Midden 3 ( $\mathrm{n}=3$ ) | 1 (50\%) | n/a | 1 (100\%) | 2 (66.66\%) |
| Midden 4 ( $\mathrm{n}=0$ ) | n/a | n/a | n/a | n/a |
| Locus2 Area1 ( $\mathrm{n}=1$ ) | n/a | $\mathrm{n} / \mathrm{a}$ | 1 (100\%) | 1 (100\%) |
| Locus2 Area2 ( $\mathrm{n}=0$ ) | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | n/a | n/a |

whiteware vessels that could be placed into vessel sets, 22 (55.00\%) are from sets associated with the manor house. Only Midden 1 Main and Midden 2 had enough vessels to assess the distribution of manor house whitewares throughout the site. In both areas, the percentage of vessels from sets associated with the manor house increased by over $10 \%$ compared to the pearlwares ( $14.06 \%$ and $10.88 \%$, respectively), suggesting that the increase in manor houseassociated whitewares is not being driven by a shift in one part of the site. At least three factors may have contributed to the increased overlap between the whitewares. First, local merchants may have offered a (relatively) wide selection of pearlwares, but only a limited selection of whitewares, making it more likely that enslaved people and the Hites would independently acquire the same whitewares sets. However, the manor house ceramics show a marked increase

Table 14. Overlapping whiteware vessel sets between various parts of the manor house grounds and Quarter Site B.

|  | Old Hall | North of Old Hall | South of Old Hall | West of Old Hall |
| :--- | :---: | :---: | :---: | :---: |
| Number of Whiteware Vessel Sets | 73 | 38 | 24 | 12 |
| Number of Overlapping Vessel Sets | 12 | 6 | 4 | 2 |
| Percentage of Overlapping Vessel Sets | $16.44 \%$ | $15.79 \%$ | $16.67 \%$ | $16.67 \%$ |

in diversity over time, suggesting that merchants offered a wide variety of whitewares. ${ }^{73}$ Second, oral histories suggest that enslaved people lived in Old Hall after 1819 (Wootton et al. 1996, 13). Harriet Robinson and other people enslaved at Belle Grove in 1860-1864 likely lived in Old Hall, but we do not know if this practice extends back to the Hite era. If enslaved people lived in Old Hall between 1820 and 1850, the increased overlap between the quarter and manor house ceramics might be from interactions between enslaved people (e.g., Wilkie and Farnsworth 2005; A. L. Young 1997; 2003; 2004). However, sets from Old Hall are as likely to overlap with Quarter Site B as sets from other parts of the manor house grounds (Table 14), suggesting that enslaved people living in Old Hall does not account for the increased overlap. This leaves us with the final possibility, that the increased overlap in whitewares is due to enslaved people increasingly relying on ceramics from the manor house instead of vessels they acquired themselves.

The increased use of ceramics from the manor house could be from several factors. Maybe more children lived at the quarter after 1830, making it less likely that families had extra food to sell (Heath 2004). Maybe the site's residents used more second-hand ceramics so they could spend money on medicine, comfortable shoes, or spices to add new flavors to their oftenmonotonous diets (Milton 1849, 72, 116, 446, 479, 496). But if we think about the increased reliance on second-hand vessels as a decrease in the number of vessels enslaved people acquired

[^58]from cities, towns, and country stores, these data tell a similar story to the merchants' ledgers that by the 1830 s , restrictions on enslaved people's consumption practices may have led them to find other sources of ceramics.

Against this backdrop, a colonoware plate (Vessel 6.013) from House Site 1 becomes especially interesting. Colonoware is unglazed coarse earthenware made by enslaved Africans and Native Americans (e.g., C. R. Cobb and DePratter 2012; Ferguson 1992; Hauser and DeCorse 2003; Sattes et al. 2020; Singleton and Brograd 2000). While commonly found in $18^{\text {th }}-$ century quarters, colonoware is less common on $19^{\text {th }}$-century sites in Virginia (e.g., Galke 2009, 305). The plate is one of two colonoware vessels from Quarter Site B (the other being a pot), which makes sense given that it is a $19^{\text {th }}$-century site. However, it was not found in earlier deposits, as one might expect from colonoware's $19^{\text {th }}$-century decline, but in rubble deposited when House Site 1 burned in the late 1840 s. ${ }^{74}$ Therefore, the plate probably dates to the 1840 s 1850s, the same time the cabin's inhabitants were dealing with restrictions on their ability to get imported tablewares from cities, towns, and country stores. This suggests that one of the ways enslaved people at Belle Grove may have responded to increased restrictions on their consumption practices was to turn to colonoware as an alternative to imported tablewares.

## Locally-Made Ceramics

Ever in motion, yet connected to particular paces, [clay] both holds geographical memories in its elemental structure and calls forth referential memories through its color, feel between the fingers, and quality of grain. Today's [clays] are yesterday's mountains, coral reefs, and outcroppings of stone. Each grain possesses a geological lineage that links [clay] to a place and its history, and each grain also carries a symbolic association that indexes that history as well. (Agard-Jones 2012, 326)

[^59]We can use locally-made ceramics to further assess restrictions on enslaved Shenandoahan's consumption practices. These ceramics are especially useful for looking at enslaved people's consumption practices because they are unlikely to have been acquired secondhand from the Hites. They are overwhelmingly (92.59\%) utilitarian wares used for making and storing food, and because of this, a chip in a crock or jar would not have led the Hites to discard a vessel in the way that a similar chip in a plate would have lead them to do so. Put another way, if a vessel was chipped to the point where it could no longer be used to make or store food for the Hites, it was probably too damaged for enslaved people to use. Women and men working in the manor house might still have taken a vessel or two home to use them in other ways (see Posnansky 1999), but this cannot account for the sheer number of vessels from Quarter Site B (see below). The Valley had a robust $19^{\text {th }}$-century ceramic industry (e.g., Comstock 1994a; Fennell 2017; Jolley 2004). A history of this industry is provided in Chapter 9, but for now, it is sufficient to note that with one exception, local potteries were located in cities and towns, and only two towns in the region (Charlestown and Middletown) lacked potteries in 1800-1850 (Comstock 1994a). Some potters in Newtown exported wares to Winchester (Account Book 1800, 23, 37, 47, 106, 115, 123, 131, 137, 151; Park 2001, 12), which was the largest population center and was probably the largest consumer of ceramics in the region, but scant evidence exists for potters marketing their wares outside of the towns they operated in. ${ }^{75}$ Transporting ceramics between towns cost time and money, and risked vessels breaking in transit, with Newtown potter John Pitman breaking vessels during $20 \%$ of deliveries he made to Winchester (Account Book 1800, 40, 128). Many potters also sold their wares at their workshops

[^60](Snavely 1810; Comstock 1994a, 505-7). Of the 5,473 transactions in the 1845-1849 ledger for the unnamed store in Strasburg (Milton 1849), only one includes locally-made ceramics despite four potteries operating in Strasburg, suggesting that much of the -locally-made ceramic trade took place in potteries instead of stores (at least in Strasburg).

Since peddlers did not sell ceramics, Shenandoahans living in the countryside and towns without potters had two sources for locally-made ceramics. They could buy vessels from nearby merchants (who resold locally-made vessels) or they could travel to cities/towns with potters. Most consumers seem to prefer the latter option (e.g., Pitman n.d., 7), which we can see with ledgers from Winchester and several surrounding communities. Only $0.09 \%$ of transactions in the Charlestown ledgers (Account Book 1 1795; Account Book 2 1797, 2) and $0.39 \%$ of transactions in the 1806 Middletown ledger (Account Book 1806) include locally-made ceramics, compared to $1.88 \%$ of transactions in the 1799-1800 Winchester ledger (Account Book 1800). Additionally, many people from Back Creek bought goods from Clark Cather's Winchester store (Cather 1882). When we compare this ledger to the Back Creek ledgers (Gore 1860; Homer and Nelson 1851; 1858), we see that locally-made ceramics are included in $2.63 \%$ of transactions in Winchester but only $1.31 \%$ of transactions in Back Creek. If this is indicative of consumption practices elsewhere in the Valley, most Shenandoahans bought locally-made ceramics in the municipalities they were made in. By extension, if we can determine where the locally-made vessels from Quarter Site B were made, we can use this data to map out where the site's residents acquired these ceramics. To do this, I used neutron activation analysis (NAA) to source 100 locally-made vessels from Quarter Site B.

## Neutron Activation Analysis

Many techniques exist for sourcing ceramics, with NAA and laser ablation-inductively coupled plasma-mass spectrometry (LA-ICP-MS) being among the most common. While LA-ICP-MS has been successfully used in Virginia (Bloch 2015; 2016; Bloch and Agbe-Davies 2017), NAA has not been used to source Virginian ceramics. However, I opted to use NAA for this project because it has several advantages over LA-ICP-MS. NAA is a bulk-sampling technique, simultaneously testing clay and inclusions; LA-ICP-MS, alternatively, lets researchers avoid inclusions by spot testing a sample's clay fraction (Bloch 2015; Stoner and Glascock 2012). However, Wesley Stoner (2016) notes that variations in naturally occurring inclusions, which tend not to be assessed with LA-ICP-MS, can provide important data for sourcing vessels made with similar clays. Shenandoah Valley potters did not temper their vessels (Comstock 1975, 16-17; 1994a, 21), giving NAA an advantage over LA-ICP-MS, since any variations in ceramic bodies should indicate different clay sources and not ceramic recipes. LA-ICP-MS data also have a higher margin of error (Klesner et al. 2019; Stoner 2016; Wallis and Kamenov 2013), making NAA better for assessing subtle geochemical differences within a single region.

Geochemical analyses of ceramic bodies, such as NAA, primarily tell us about the bedrocks that clays weathered out from, geological processes that affected clays after weathering from their parent material, and the types of inclusions held in place by this clay. If clay deposits and/or inclusions found within a study area are homogenous, sourcing pots made from these materials becomes difficult. Luckily, clay deposits in the Shenandoah Valley are geochemically distinctive, and potters in Winchester, Newtown, and Strasburg had access to clay from at least six different geological formations (Rader et al. 1996) (Figure 26).

Figure 26. Geological formations in the study area. Image courtesy of the Virginia Department of Mines, Minerals, and Energy.

To determine the elemental signature of clay deposits used by potters working in different towns I analyzed 89 wasters (kiln furniture and vessels that broke during firing) from five potteries in the northern Valley (Figure 27). These samples came from Winchester ( $\mathrm{n}=33$ ), Newtown (modern-day Stephens City, $\mathrm{n}=36$ ), and Strasburg ( $\mathrm{n}=20$ ). Twelve of the 16 potteries within walking distance of Belle Grove are located in these municipalities (Comstock 1994a). The remaining four potteries are in Woodstock, which I could not include in this study because no collections were available. The first workshop I studied was the Peter Lauck Pottery (17801839) in Winchester. Although formal excavations have not been conducted at this site (Jolley 2004, 95), surface collections have recovered hundreds of sherds from Lauck's workshop. The second was the Anthony Bacher Pottery (1862-1889) in Winchester, excavated in 2002 (Espenshade and Kennedy 2002). The third site was the Andrew Pitman Pottery (c. 1782-1838) in Newtown, excavated in 1996-2000 (Park 2001). The fourth was the John Pitman Pottery (1794-1820s) in Newtown, where a waster pile was excavated in 1998 (Pullins and Hatcher

Figure 27. Location of potteries sampled by NAA.
2002). The final pottery was the Strasburg Steam Pottery (1890-1897) in Strasburg, excavated in 2014 (Jolley 2018). The Bacher and Strasburg Steam Potteries postdate Quarter Site B, but both used local clay (Comstock 1994a) so these samples should be representative of the sources used
by earlier potters. To avoid sampling vessels twice, I only selected sherds with different glaze colors and/or rim styles from the Lauck and John Pitman Potteries. Lindsay Bloch (2015, 90) used a similar method to select the Andrew Pitman and Bacher samples. Most of the Strasburg Steam samples are kiln furniture and I only analyzed intact specimens.

I took the Quarter Site B samples from 100 different coarse earthenware and stoneware vessels. I identified each vessel using the same protocol for the minimum vessel analysis used on the imported ceramics. To ensure I was analyzing samples from across the site, I selected 20 of the 64 vessels from Midden 1 Main, seven of the 20 vessels from Midden 1 Southwest, 17 of the 48 vessels from Midden 2, all 21 vessels from Midden 3, and all five vessels from Midden 4 (also see Figure 25). ${ }^{76}$ I also analyzed all seven vessels from the earlier root cellar and five of the seven vessels from the later subfloor pit.

I conducted the NAA at the Missouri University Research Reactor using the laboratory's standard procedures (Glascock 1992; Glascock and Neff 2003). The samples' glazes were removed, and exposed portions of the body were abraded using a silicon carbide burr before being washed in deionized water, air dried, and powdered in an agate mortar and pestle. Two analytical samples were prepared from each ceramic specimen, with $\sim 100 \mathrm{mg}$ placed into highdensity polyethylene vials for short irradiations and $\sim 200 \mathrm{mg}$ placed into high-purity quartz vials for long irradiations. The short-duration samples were irradiated for 5 seconds at a neutron flux of $8 \times 10^{13} \mathrm{ncm}^{-2} \mathrm{~s}^{-1}$, and allowed to decay for 25 minutes before gamma-ray emissions were measured using a hyper-pure germanium detector for elements that produce short-lived radioisotopes: aluminum $(\mathrm{Al})$, barium $(\mathrm{Ba})$, calcium $(\mathrm{Ca})$, dysprosium $(\mathrm{Dy})$, potassium $(\mathrm{K})$, manganese (Mn), sodium ( Na ), titanium (Ti), and vanadium (V). The long-duration samples

[^61]were irradiated for 24 hours at a neutron flux of $6 \times 10^{13} \mathrm{ncm}^{-2} \mathrm{~s}^{-1}$, and left to decay for 7-10 days, before being measured for 2,000 seconds for medium-lived radioisotopes: arsenic (As), lanthanum (La), lutetium (Lu), neodymium (Nd), samarium $(\mathrm{Sm})$, uranium $(\mathrm{U})$, and ytterbium $(\mathrm{Yb})$. After an additional 2-3 weeks, the samples were measured again for 8,200 seconds to obtain data on elements that produce long-lived radioisotopes: cerium (Ce), cobalt (Co), chromium $(\mathrm{Cr})$, cesium $(\mathrm{Cs})$, europium (Eu), iron (Fe), hafnium (Hf), nickel (Ni), rubidium ( Rb ), antimony (Sb), scandium (Sc), strontium (Sr), tantalum (Ta), terbium (Tb), thorium (Th), zinc $(\mathrm{Zn})$, and zirconium $(\mathrm{Zr})$. All irradiations included National Institute of Standards and Technology standard reference materials (SRM-1633b, SRM-688, SRM-278), and New Ohio Red Clay for data calibration and quality control. The three sets of measurements provided concentration values for 33 elements (Appendix E, Tables 5 and 6). Ni values for $41 \%$ of the samples did not exceed the limits of detection, so I excluded Ni from the following analysis.

The main goal when interpreting compositional data from ceramics is identifying, refining, and validating statistically distinct groups, each of which may be thought of as a discrete cluster of samples with similar values for certain elements (e.g., Baxter and Buck 2000; Bieber et al. 1976; Bishop and Neff 1989; Glascock 1992; Glascock and Neff 2003; Neff 2000; Weigand et al. 1977). Using a combination of hierarchical cluster analysis, bivariate scatterplots, and principal component analysis, Brandi Macdonald and I identified and refined six compositional groups in the dataset (Greer and MacDonald 2020) (Figure 28, Table 15). We used base-10 logarithms of concentrations in our calculations instead of raw data as this creates more normalized distributions for trace elements (e.g. rare earth elements) and compensates for differences in magnitude between trace elements and those present in larger concentrations (e.g.

Figure 28. Scatterplot of PC1 (29.3\%) versus PC2 (21.2\%), showing the distribution of Compositional Groups 1-6. Ellipses are drawn at $90 \%$ confidence. Sample SYU085, which is likely made outside of the Shenandoah Valley, is in the middle of the top axis.

Al, $\mathrm{Ca}, \mathrm{Fe}$ ) (Baxter and Freestone 2006; Bieber et al. 1976; Glascock et al. 2004). We statistically validated the groups using Mahalanobis Distance (MD), which reports the percent probability of a sample belonging to a compositional group, with $100 \%$ indicating that a sample definitively belongs to a particular group and $0 \%$ indicating that there is no chance that a sample belongs to that group. Our results suggest strong group assignments (>20\%) for $88 \%$ of the samples (Appendix E, Tables 7 and 8 ).

Group 1 has elevated As, Fe, K, and Rb and depleted Hf and Zr. This group has 73 samples, of which 29 are wasters, and 44 are from Belle Grove. Nine of the wasters are from the

Table 15. NAA compositional grounds by site.

| Site | Location | Group 1 | Group 2 | Group 3 | Group 4 | Group 5 | Group 6 | Outlier |
| :--- | :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Peter Lauck | Winchester | 2 | 3 |  | 4 |  | 8 | 3 |
| Anthony Bacher | Winchester | 4 | 5 | 1 |  |  |  | 3 |
| Andrew Pitman | Newtown | 13 | 1 | 1 |  |  |  | 1 |
| John Pitman | Newtown | 9 | 4 | 2 |  |  |  | 5 |
| Strasburg Steam | Strasburg | 1 |  |  | 13 | 2 |  | 4 |
| Quarter Site B | Belle Grove | 44 | 6 | 18 | 14 | 7 | 1 | 10 |
| Total |  | $\mathbf{7 3}$ | $\mathbf{1 9}$ | $\mathbf{2 2}$ | $\mathbf{3 1}$ | $\mathbf{9}$ | $\mathbf{9}$ | $\mathbf{2 6}$ |

John Pitman and 13 are from the Andrew Pitman Potteries, both in Newtown, while four come from the Bacher and two come from the Lauck Potteries in Winchester. The final waster comes from the Strasburg Steam Pottery. Having wasters from all three municipalities in Group 1 suggests that it represents clays from a widely-used geological formation. However, $91 \%$ of the Newtown wasters have strong membership probabilities, compared to $33 \%$ of the Winchester wasters and none of the Strasburg samples, giving Group 1 a stronger association with Newtown. This suggests that the group's Belle Grove samples are probably from Newtown.

Group 2 contains 19 samples, 13 wasters, and six from Belle Grove, and has elevated Ta and Ti and depleted Ca . Five of the wasters come from the Bacher and three come from the Lauck Potteries, while four come from the John Pitman Pottery and one came from the Andrew Pitman Pottery. This suggests that Group 2 represents clay from a geological formation used in Winchester and Newtown, with the Belle Grove samples being made in either municipality.

Group 3 has elevated Ta and Ti (more so than Group 2) and depleted Mn and Zn and contains four waster samples and 18 samples from Belle Grove. Two wasters are from the John Pitman Pottery and one each is from the Andrew Pitman and Bacher Potteries. The presence of wasters from Newtown and Winchester in Group 3 suggests that this represents clay from a geological formation used by potters in both towns. As with Group 1, most (75\%) of the wasters
come from Newtown, but all wasters have strong membership probabilities, making it difficult to determine if Group 3 is associated with Newtown or Winchester. However, 14 of the 18 Belle Grove samples are stoneware, which records indicate were made in Winchester but not Newtown (Comstock 1994a). Unless refire analyses determine that Newtown clays can produce stonewares (raising the possibility of a stoneware tradition in Newtown) it seems likely that Group 3's stonewares are from Winchester. ${ }^{77}$

Group 4 has elevated $\mathrm{Dy}, \mathrm{Eu}, \mathrm{Sm}, \mathrm{Sr}$, and Tb . This group has 31 samples, 17 of which are wasters and 14 of which come from Belle Grove. Thirteen of the wasters come from the Strasburg Steam Pottery and the remaining four are from the Lauck Pottery. This suggests that Group 4 is from a geological deposit used by potters in both Strasburg and Winchester but possibly used more extensively in Strasburg as $76.47 \%$ of the wasters are from this town. All waster samples have strong membership probabilities, preventing the MD calculations from determining if Group 4 is predominately associated with one town and suggesting that the Belle Grove samples are from either Strasburg or Winchester.

Group 5 contains 9 samples, two wasters and seven samples from Belle Grove, and is defined by elevated Mn and Na and depleted Fe . Both wasters are from the Strasburg Steam Pottery, giving Group 5 a strong association with Strasburg. As a result, we can safely argue that the seven Belle Grove samples in this group are from Strasburg.

Group 6 is the most distinct, with elevated $\mathrm{Al}, \mathrm{Ba}, \mathrm{Ce}, \mathrm{Co}, \mathrm{Dy}, \mathrm{Eu}, \mathrm{K}, \mathrm{La}, \mathrm{Nd}, \mathrm{Ni}, \mathrm{Rb}, \mathrm{Sc}$, $\mathrm{Sm}, \mathrm{Tb}$, and Zn , and depleted $\mathrm{Hf}, \mathrm{Sb}, \mathrm{Ta}, \mathrm{Th}, \mathrm{Ti}$, and Zr . It includes eight wasters, all from the Lauck Pottery, and one Belle Grove sample. This gives Group 6 a strong association with

[^62]Winchester and suggests that the one Belle Grove sample was made there. Winchester is closest to the Conocheague and Elkbrook formations (see Figure 26), giving local potters easier access to clay weathered from these bedrocks than potters in Newtown or Strasburg. These may be the geological formations from which the clays used in Group 6 were excavated.

Twenty-six samples could not be placed into compositional groups. Of the 10 unassigned samples from Belle Grove, one (SYU085) is especially distinct, suggesting that it was imported into the Valley. The remaining nine samples generally conform to the wasters' chemical composition, suggesting that they are from the Valley, possibly Woodstock. Sixteen wasters were unassigned, suggesting that Groups 1-6 do not capture the full range of elemental variation amongst the Winchester, Newtown, and Strasburg ceramics. Therefore, we cannot rule out the possibility that the nine Belle Grove samples were made in these towns but belong to a currently unidentified compositional group.

## Cities, Towns, and Locally-Made Ceramics

The NAA results indicate that the residents of Quarter Site B went to Winchester, Newtown, and Strasburg to acquire locally-made pots. If we can count the Group 3 stonewares as being from Winchester, then 15 of the 99 locally-made vessels were likely bought in the city. Winchester is 15 miles north of Belle Grove, so the women and men enslaved at the plantation probably did not go to the city as often as John Spradley, who lived only five miles from Winchester. But, they might have been among those whose Sunday trips the Agricultural Society of the Valley argued were days spent in "intemperance and immorality" (Barton and Cramer 1826). The lack of compositional groups not associated with Winchester, Newtown, and Strasburg strongly suggests that enslaved people did not regularly travel from Quarter Site B to Woodstock to acquire locally-made ceramics. Like Winchester, Woodstock is about 15 miles

Figure 29. Features 3 and 24, east/west profile, facing north. Image by author.
from Belle Grove. However, Woodstock is considerably smaller, possibly making long trips to the town more trouble than they were worth.

The best way to historicize this data is to focus on the vessels from the root cellar (Feature 3) and subfloor pit (Feature 24). The root cellar is a large (approximately 9' x 8') feature underneath House Site 1, likely used to store food from the time the cabin was built (c. 1800) until the late 1830s when it was backfilled to create a smaller (approximately 7 ' x 4 ') subfloor pit within the root cellar fill (Figure 29). Subfloor pits are small cellars enslaved Virginians commonly used to store food and/or personal items (Samford 2007). The root cellar fill contains 23 wound-head straight pins and four stamped-head straight pins, and the subfloor pit fill contains a mix of seven wound-head and nine stamped-head pins. Stamped-head pins were introduced in 1836 and quickly replaced the earlier wound-head straight pins (Beaudry 2006, 19). For there to be only a small number of stamped-head pins in the root cellar fill and a more even ratio of wound to stamped heads in the subfloor pit fill, the root cellar must have been backfilled shortly after stamped-head pins were introduced. The subfloor pit was used into the

1850s, when the cabin burned, filling the pit with charred architectural material and household items. As a result, vessels from the root cellar fill were deposited in the late-1830s, while those found in the subfloor pit fill were deposited in the 1850s.

Two of the root cellar vessels belong to Group 1, one each to Groups 2 and 3, two belong to Group 4, and one was unassigned. In other words, we have two vessels from Newtown (Group 1), one from either Newtown or Winchester (Group 2), one from Winchester (the Group 3 vessel is stoneware), and two from either Strasburg or Winchester (Group 4). The subfloor pit vessels, on the other hand, include two vessels from Group 4 and three from Group 5, meaning that three are from Strasburg and two are either from Strasburg or Winchester. This suggests that by the late 1830s we see a change in where the enslaved people living in House Site 1 acquired locallymade ceramics, from possibly traveling to Winchester, Newtown, and Strasburg to only going to Strasburg and possibly Winchester. We can interpret this in several ways (see Greer and MacDonald 2020), but I would argue that part of what we are seeing is a restriction on where people enslaved by the Hites could acquire locally-made ceramics, resulting in the site's residents getting vessels from fewer places by the late 1830s. Here it is especially important to note that Strasburg is the closest ceramic-producing town to Belle Grove, so in the 1840s we are seeing a possible shift toward enslaved people acquiring ceramics closer to home.

Using NAA data from 12 vessels to make this argument might be tenuous. But, so would only using data from merchants' ledgers or the proportion of vessels that came second-hand from the manor house. However, what we have here is three independent lines of evidence converging to make a robust argument about how increasing restrictions on enslaved people's consumption practices limited enslaved Shenandoahans' ability to acquire commodities. This is not to say that restrictions determined enslaved people's consumption practices, but that over
time restrictions played a larger and/or more effective role within enslaving assemblages, orienting (sensu Ahmed 2007) enslaved people in ways that made it more difficult to access cities, towns, and stores. This argument also lines up with what we know about enslavers' everincreasing understanding that the actions of enslaved consumers were an area where the ontological politics of enslaved life could and should play out. When we frame our narrative of the increased restrictions in these terms, we see Valley enslavers increasingly enacting a particular way of being human (a homo rationalius that can bring order to the supposedly chaotic nature of Blackness) by regulating enslaved people's consumption practices.

A lot of the literature that discusses restrictions on enslaved people's consumption practices focuses on South Carolina (e.g., Campbell 1991; Fogle 2019; Forret 2004; Hill Edwards 2017; 2021; K. M. Hilliard 2014). ${ }^{78}$ And this body of work suggests that enslaved people found ways to continue buying, selling, and trading commodities, in large part because enslavers recognized that they played an important role in local economies (Hill Edwards 2021). My work suggests something different was going on in the Valley. This may be because the combination of sources I used speak to aspects of enslaved people's consumption practices that were more likely to be affected by restrictions. If I used different types of data (like buttons, which could be sold by peddlers), or if these other studies used my methods, maybe we would have reached the same conclusions. Or, perhaps more likely, the Valley is simply different than South Carolina. We will not know until more studies in other areas address restrictions enslavers placed on enslaved people's consumption practices. But we do know that, just like enslaved South Carolinians, enslaved Shenandoahans used the things they acquired to make lives for themselves. And because ceramics played such an important role in this chapter, we should

[^63]continue to trace out the ways ceramic vessels got incorporated into enslaving assemblages, and the possibilities they created for making do within the confines of slavery. Chapter 8 does this by focusing on imported tablewares, while Chapter 9 takes up locally-made utilitarian wares.

## Chapter 8: Imported Tea and Tablewares

One cannot expect African Americans, who have traditionally been relegated to peripheral sites within American society and culture, to interact with technological products analogously to the members of the dominant American culture...
(Fouché 2006a, 642)
On 4 January 1797, James, a man enslaved by William Little, bought a set of teacups and saucers from a store in Charlestown, Virginia (now West Virginia) (Account Book 2 1797, 340) (Figure 30). While James did not buy costly Chinese porcelain tea wares, he did choose one of the more expensive refined earthenware sets the store offered (Account Book 1 1795; Account Book 2 1797). We will never know why, exactly, James selected and bought these cups and saucers (see Chapter 2). But the poetics of this act, and the things James did with these ceramics once he got home, captures the imagination today.

James's choice to buy tea wares contradicts popular conceptions of slavery, causing awe and confusion among visitors to Belle Grove Plantation when we tell them about similar purchases made by enslaved women and men living at Quarter Site B. This forces many to reevaluate what they know about slavery and to reimagine the Shenandoah Valley's complex political economies. Honestly, I was fascinated by the idea of enslaved Southerners buying tea wares and other ceramics for themselves when I first learned about these practices, and my desire to know more about this aspect of enslaved life led me down a winding path toward Belle Grove. Many archaeologists are also fascinated by the decisions enslaved people made about which ceramics to acquire (e.g., Galle 2010; Symanski 2012; Wilkie and Farnsworth 2005). Why did James buy teacups and saucers, and why did he choose this particular set when others cost half as much? The cups and saucers were probably decorated, so what was it about these designs that

Figure 30. Hand-painted teacup and saucer from Quarter Site B. While we do not know what the cups and saucers James bought would have looked like, they may have looked like this set from Belle Grove. Photographs by Erica G. Moses.
may have appealed to James? When coupled with archaeologists' love affair with ceramics, it comes as no surprise that imported refined earthenwares play a large role in archaeologies of enslaved life (e.g., L. W. Marshall 2015; Ogundiran and Falola 2007; Singleton 1985; 1999).

Existing studies, however, often focus on vessel form and/or decoration (e.g., Arcangeli 2015; Galle 2010; Otto 1977; 1984; Symanski 2012; Wilkie and Farnsworth 2005; A. L. Young 2004). These can tell us a lot about enslaved people, especially the consumer choices they made, and the social bonds they created and maintained. But what these works have not been able to do is offer convincing arguments for how enslaved people used these vessels to eat and drink. This is because they rely on abstract arguments based on vessel form instead of a sustained investigation of physical evidence from these ceramics. Or perhaps more accurately, they rely on physical evidence only to the extent that a sherd or vessel can be identified as a plate, bowl, or teacup. Once these forms have been identified, it is the form of the vessel that drives all subsequent arguments, not any other data from the vessel. In other words, we get arguments that enslaved people used plates and bowls to eat different types of food not because of any evidence collected from these ceramics, but simply because they have different shapes (e.g., Otto 1977;
1984). Doing so uncritically projects our normative understandings of how ceramic can be used onto past people, who may have had different understandings about what a plate or bowl should be used for. As Rayvon Fouché argues in this chapter's epithet, these normative assumptions about ceramic use are also racialized, making them especially problematic when we project them onto enslaved people. Therefore, making better arguments about how enslaved people used ceramic vessels requires we need to turn to new sources so physical evidence from these vessels.

This chapter focuses on use-wear and absorbed residues from imported ceramic tea and tablewares from Quarter Site B. Combined, these analyses provide a robust dataset for making arguments about how enslaved women and men used imported ceramics that rely on material evidence gathered from individual vessels. Specifically, they suggest that enslaved people used plates and bowls for their intended uses. However, data presented below from mugs and teacups suggest that these were used for consuming beverages and (at least occasionally) for eating, while saucers have extensive evidence for being used as bowls. These ways of using ceramics show enslaved Shenandoahans reconceptualizing (sensu Fouché 2006a) how imported tea and tablewares should be used, allowing them to enact ways of being human that redressed the pain and suffering imposed on them by the Hites.

## Ceramic Alteration

## Use-Wear Analysis

Ceramics constantly rub against the people and things they are assembled with, creating friction that abrades their surfaces and leaves traces that provide information about how they were used (Griffiths 1978; Schiffer and Skibo 1989; Skibo 1992; 2013). Systematically studying these traces and comparing how similar wear patterns repeat on certain types of ceramics can tell us how enslaved people used different ceramics and what types of foods and beverages they
ate/drank from them. To assess this, I performed a use-wear analysis on Quarter Site B’s 283 imported ceramic vessels.

Use-wear analyses often lack "sufficiently well-defined and standardized" methods for comparing large numbers of vessels (Banducci 2014, 189). For instance, Matthew Reeves (2015a, 31-32), in a rare use-wear analysis from enslaved quartering sites, compared a lack of "deep scratches" on tea wares from Virginia and an abundance of these traces on bowls from Jamaica to make inferences about enslaved foodways. But his data comes from general observations instead of a systematic assessment with clearly defined parameters, as he does not quantify his results, nor does he define what counts as "deep" scratches or mention if he assessed other types of wear. ${ }^{79}$ This limits the types of arguments Reeves could make about these ceramics. To avoid this issue, I used standardized methods provided by Laura Banducci (2014) and Vanessa Fotre et al. (2018). I assessed every sherd from each imported vessel for wear. This was done without magnification, although I assessed the amount of abrasive wear on the edges of each trace with a 40x hand-held microscopic lens (Banducci 2014, 192-94). Once each trace was identified and inspected, I recorded the side of the vessel it was on (interior or exterior), its location on the vessel (rim, wall, etc.), the mechanism that produced it (fatigue wear from being struck by a solid object, abrasive wear from utensils grinding against vessels, or thermal wear from heat sources), the type of trace (spall [a portion of the ceramic that chipped away], linear striation, or patch [large, non-linear/ovaloid concentration of wear], thermal discoloration, and charred encrustations from burned food), the shape of the trace in plan-view (ovaloid [including semi-circular traces], linear, irregular, indeterminate), the amount of wear on the top edge (high, mid, low), the orientation of the trace relative to the vessel (vertical, horizontal, or diagonal), and

[^64]its length and width. Fatigue wear and spalling can be from post-depositional processes like trampling or freeze/thaw cycles (e.g., Schiffer 1987), so I only analyzed fatigue wear/spalling with abrasive wear along its top edge, since these indicate that the vessels continued to be used after the initial wear occurred.

Some vessels only have one sherd, while others have over 20. This makes systematic comparisons somewhat problematic, since having more sherds to work with increases the chance of identifying wear. Additionally, certain types of vessels are more likely to include sherds from different locations. For instance, $78.72 \%$ of plates have rim sherds compared to $41.17 \%$ of mugs and $18.18 \%$ of bowls. To prevent this from skewing my analysis, I accounted for the number of sherds per vessel and the location of these sherds whenever possible.

## Absorbed Residues

Ceramics often become assembled with organic molecules from food and drinks that are stored, cooked, served, or consumed in/from them. If these molecules only interact with a vessel's glaze, or if the ceramic has a vitrified body, traces of these assemblages are easily washed away. But if food/beverages come into direct contact with earthenwares' porous bodies, they can absorb into ceramics, leaving traces we can identify through residue analysis (e.g., Condamin et al. 1976; Evershed 1993; 2008a; Pecci 2014). While all the imported earthenwares from Quarter Site B are glazed, the use-wear analysis identified 94 areas on 47 vessels where the glaze was removed, creating openings for residues to seep in while the vessels were still being used (Pecci et al. 2016). To identify these residues, I analyzed 34 chipped portions of 20 vessels using Fourier-transform infrared spectroscopy (FTIR) (Table 16). This includes all chipped areas that were large enough to provide adequate material for the FTIR analysis while leaving at least

Table 16. Imported tableware FTIR samples. All creamware vessels are common creamware, sold locally into the mid-19th century

half of the area preserved for future analyses, including gas chromatography-mass spectrometry (GC-MS) and stable isotope analysis.

FTIR measures the amount of infrared light samples absorb at various wavenumbers (B. C. Smith 1999). For instance, a sample might absorb $40 \%$ of infrared light at $3000 \mathrm{~cm}-1$ and $80 \%$ at $2500 \mathrm{~cm}-1$, but none at $2000 \mathrm{~cm}-1$ or $1000 \mathrm{~cm}-1$. Absorption rates are determined by chemical bonds within molecules, as different types of bonds ( $\mathrm{C}=\mathrm{O}, \mathrm{H}=\mathrm{O}$, etc.) absorb light in unique ways (e.g., Margaris 2014; Shoval 2017; B. C. Smith 1999). As a result, FTIR provides indirect evidence for the chemical makeup of a ceramic body and residues that absorbed into it (e.g.,

Annamalai et al. 2020; Forte et al. 2018; Lettieri 2015; Oliveira et al. 2020; Roth et al. 2018; Shillito et al. 2009; Tanasi et al. 2017).

I prepared the samples by scraping the ceramic with a pick to produce a fine powder. The powder was put into a borosilicate glass vial along with 0.4 ml of dichloromethane and methanol $(2: 1, \mathrm{v} / \mathrm{v})$, which extracted residues from the sample so I could analyze them with minimal interference from the ceramic body (e.g., Barnard et al. 2007; Craig et al. 2020; Gregg and Slater 2010; McGovern and Hall 2016, 618-19; Regert 2011, 180; Roth et al. 2018, 272). Each vial was sealed, sonicated (2x10min), and left to sit for 23 hours (Barnard et al. 2007, 33; Regert 2011, 180). Three drops of the solution were then placed onto a glass microscope slide and allowed to evaporate for an hour, leaving behind dried residues for analysis. I used these same methods to prepare samples from non-chipped portions of each sherd to create a control group to identify infrared signatures that are from post-depositional processes and/or are from residues not associated with historic foods/beverages (Lettieri 2015; Stern et al. 2000).

I analyzed each sample three times in ATR (attenuated total reflectance) mode on a ThermoFisher Nicolet iS5 FTIR spectrometer with an iD7 ATR accessory using the default setting for this instrument and identified 3,162 peaks (high absorbance values for particular wavenumbers) in the resultant data (Appendix F, Table 1). I removed 2,856 peaks associated with 21 commonly occurring peak ranges that are likely from the extraction solution, the microscope slide, surface contamination, and/or portions of the ceramic body suspended in the extraction solution (Appendix F, Table 2). To further refine the dataset, I eliminated any peak from samples that were within $5 \mathrm{~cm}-1$ of peaks from the control group or control samples from 38 locally-made vessels (see Chapter 9) (Appendix F, Table 3). Discarding peaks associated with control samples is not common practice but doing so creates a more reliable dataset for
comparing different types of vessels since none of the peaks should be from post-depositional processes.

The data reduction left me with 26 peaks from 12 samples that are associated with absorbed residues. To identify the foods and beverages these residues may have come from, I compared them with data from the reference library presented in Appendix F (Table 4). This includes peaks for substances enslaved people likely consumed that are listed in archaeological and non-archaeological studies (Abdalla 2015; Abdullah et al. 2018; Aziz et al. 2015; Babu et al. 2015; Barua et al. 2008; Bitik et al. 2019; Cameo 2019; Candoğan et al. 2021; Cummings and Kovácik 2018; Cummings and Logan 2012; Cummings et al. 2010; Ding et al. 2020; El-Kaaby et al. 2016; Ferry et al. 2013; Husnil et al. 2019; Irnawati et al. 2019; Javadi Doodran 2020; Joel et al. 2018; Kamar et al. 2016; Lakshmipathy and Sarada 2015; Logan and Cummings 2012; Millipore Sigma 2021; Stevanović et al. 2019; Trivedi et al. 2015; Palei et al. 2016; Păucean et al. 2017; Puseman et al. 2009; Puseman et al. 2012; Rohman and Che Man 2011; University of Tartu n.d.; Vahur et al. 2011; Vahur et al. 2016; Xie et al. 2016; Wahyono et al. 2019; Weiner 2010). I also collected data using the methods listed above for substances I could not find in the existing literature (Appendix F, Tables 5 and 6 ). When comparing my data to the reference library, I focused on substances with peak ranges within $5 \mathrm{~cm}-1$ of the ceramic samples (cf. Cummings and Logan 2012). I only considered non-food residues (resins, uric acid, etc.) when no foods fell within the $5 \mathrm{~cm}-1$ range.

## Tablewares

The imported tablewares are predominately plates ( $\mathrm{n}=93$ ), mugs, $(\mathrm{n}=17)$, and bowls $(\mathrm{n}=10)$. Archaeologists often assume enslaved people used tablewares for their intended purposes, eating different types of food from plates and bowls and drinking beverages from
mugs (e.g., Otto 1977; 1984). However, if we want to make empirical arguments about how enslaved people used these vessels, we need to assess use-wear and absorbed residues.

I observed 47 wear marks on 28 plates, including 33 traces on the interior of 21 vessels (Appendix F, Table 7). Most (84.84\%) interior wear was spalling and abrasion on, or within 3 cm of, rims. Enslaved people probably did not place food this close to the rim, so these wear marks likely came from vessels being handled. Three of these traces on two vessels were analyzed by FTIR (R051 and R056), but none had peaks associated with food residues. The remaining traces, one spall and five long ( $5-22 \mathrm{~mm} \times 1 \mathrm{~mm}$ ) abrasive striations, are on the bases of three plates. Edgewear on these striations suggests that three are from forks or spoons and one is from a knife (see Griffiths 1978). Most (69.23\%) exterior wear was also fatigue spalls and abrasions on or within 3 cm of rims, likely from vessels being handled. The remaining exterior wear consisted of abrasions and spalls on the foot rings from the plates being picked up and set down. While this provides relatively little evidence for how enslaved people used plates, the data suggest that some were used to eat foods that required utensils.

I observed wear marks on six bowls, four of which have interior wear (Appendix F, Table 8). Five wear marks are small to large ( $2-5 \mathrm{~mm} \times 1-6 \mathrm{~mm}$ ) ovaloid abrasions running horizontally along interior walls from enslaved people scraping food out of bowls. Four small to large (1$7 \mathrm{~mm} \times 1-5 \mathrm{~mm}$ ) ovaloid spalls and irregular striations from fatigue wear were also identified on the interior walls, three of which are orientated vertically, indicating that they are from utensils lowered down into the bowls. The exterior wear consists of 10 small to medium ( $2-5 \mathrm{~mm} \times 1-$ 4 mm ) ovaloid spalls from fatigue wear that occurred while the bowls were being handled.

I analyzed three bowls with FTIR, and all have peaks from food residues (Table 17).
Vessel 1.026 has a peak at $595 \mathrm{~cm}-1$ corresponding to blackberries and cucumbers, suggesting it

Table 17. Food residues from bowls. Peak values are in cm-1.

| Vessel | Run | Location | Wear Mechanism | Trace | Peak | Likely Source |
| ---: | :---: | :--- | :--- | :--- | :--- | :--- |
| 1.026 | R053-1-B1 | Wall | Abrasive | Striation | 595 | Blackberries (599) |
|  |  |  |  |  |  | Cucumber flesh (598-595) |

held fruit or vegetables. Vessel 1.179 has a peak at $571 \mathrm{~cm}-1$ corresponding to boiled cornmeal, steeped corn coffee, and starch, suggesting this bowl was used to consume corn, either as parched corn coffee (a coffee substitute made by boiling roasted cornmeal) or, more likely, boiled cornmeal. Vessel 1.188 has a peak at $1128 \mathrm{~cm}-1$ corresponding to aromatic esters, black tea, galactan (a polysaccharide found in legumes), starch, and sucrose. The wide range of associated substances makes interpreting this peak difficult. The combined data suggest that enslaved people at Quarter Site B ate a variety of foods from bowls. And this left a lot of visible wear on these vessels, with $40 \%$ of bowls and $16.32 \%$ of bowl sherds having interior wear. Unfortunately, we do not have enough data to tell if different bowls were used for different types of food. But we do have enough data to compare bowls and mugs so we can tease out how these vessels were used relative to one another.

I observed wear marks on eight mugs, four of which have interior wear (Appendix F, Table 9). The interior wear includes seven large (6-12 mm x 3-8mm) linear and ovaloid abrasive striations running horizontally along vessels' walls, probably from utensils scraping the inside of the mugs. There were also two medium ( $3-4 \mathrm{~mm} \times 2-3 \mathrm{~mm}$ ) ovaloid spalls from fatigue wear. The exterior wear, which occurs on seven mugs, includes 10 medium to large ( $3-10 \mathrm{~mm} \times 3-5 \mathrm{~mm}$ )
ovaloid and irregular spalls and four linear striations and patches of abrasive wear on walls, two abrasive striations on rims, and abrasive patches ( $\mathrm{n}=4$ ) and spalling ( $\mathrm{n}=1$ ) on foot rings. These are probably from mugs getting chipped and abraded while being handled. I analyzed four mugs using FTIR, three of which have peaks associated with food residues (Table 18). Vessel 1.064 has a peak at $1108 \mathrm{~cm}-1$ that corresponds with eggs, fruits, starches, and vegetables, making it difficult to interpret this data. Vessel 2.048 has peaks at $1707 \mathrm{~cm}-1,1071 \mathrm{~cm}-1,956 \mathrm{~cm}-1,949$ $\mathrm{cm}-1$, and $2180 \mathrm{~cm}-1$. The first four are associated with eggs, fruit, starches, and vegetables, making it impossible to offer any firm suggestions about what was consumed from the mug. The remaining peak corresponds with thiocyanate, which commonly occurs in cruciferous vegetables (Vanderpas 2003), suggesting that the mug may have been used for eating greens. Vessel 6.015 has a peak at $708 \mathrm{~cm}-1$ corresponding with aromatic esters, boiled cornmeal, parched corn coffee, and starch, suggesting it was used to consume either boiled cornmeal or corn coffee.

Compared to the bowls, few ( $23.52 \%$ ) mugs have interior wear. The mugs generally have fewer sherds than the bowls ( 3.41 vs. 5.0 ), but this is probably not skewing the results as fewer mug sherds have interior wear ( $10.34 \%$ vs. $16.32 \%$ ). However, mugs with wear have more interior wear per vessel than bowls (an average of 2.25 traces vs. 1.66), suggesting that enslaved people used most mugs in ways that did not leave visible wear marks while using some in ways that left an abundance of traces. The former vessels were probably used for their intended purpose of consuming beverages, as this leaves no visible traces other than the possibility of small abrasions from stirring drinks. The latter mugs were used for eating food, as they have long linear abrasions that are not from stirring (where utensils strike then bounce off vessels' walls) but prolonged pressure on walls to scrape out food. This is not to suggest that some mugs were only used for eating but that enslaved people likely considered mugs to be versatile vessels that

could be used for both drinking and eating. Despite this versatility, mugs are relatively rare at Quarter Site B, accounting for just 7.52\% of imported ceramic vessels whose form could be identified. This might be because a variety of other hollowwares were available, from gourd vessels enslaved people could make for themselves to store-bought tinware, wooden bowls, and locally-made ceramic tablewares (10 of which were identified at Quarter Site B). But we also need to consider the possibility of tea wares being used in the same way as mugs.

## Tea Wares

We found a lot of tea wares at Quarter Site B, including at least 38 saucers, 51 teacups, two sugar bowls, three teapots, and 10 indeterminate vessels. About half (54.43\%) are not from vessel sets associated with the manor house, indicating that enslaved women and men acquired dozens of teacups and saucers for themselves. ${ }^{80}$ The existing literature suggests two possible ways they may have used these vessels. Enslaved people could have used the teacups and saucers to drink tea, coffee, or other beverages (Galle 2010, 26; Lentz 2010, 29; Kelso 1997; Neiman et al. 2000, 19, 52; Wilkie and Farnsworth 2005, 255-57). Alternatively, soups, sauces, and relishes are commonly eaten as side dishes and condiments throughout the Black Atlantic (e.g., Basden 2006, 47; Beoku-Betts 1994, 427; Covey and Eisnach 2009, 42, 43, 84, 89; Eves 2005; Galan et al. 1990; Stoller and Olkes 2012). In West Africa, these are commonly served in small pots/bowls (Ferguson 1992, 97; Wilkie 2000a, 147). Because teacups and saucers are, ultimately, small bowls/dishes, archaeologists have argued that enslaved people used them to serve and eat soups, sauces, and relishes (e.g., Samford 2007, 99; Singleton 2015b; Wilkie 2000a, 147; Wilkie

[^65]and Farnsworth 2005, 252, 272). Both approaches, however, rely on generalizable arguments based on vessel form. The one exception to this is Matthew Reeves's (2015a) use-wear study (see above), but as noted earlier, his work is hindered by its reliance on general observations instead of systematically assessing wear marks. To see how the women and men living at Quarter Site B used the teacups and saucers they acquired, we need to thoroughly evaluate the use-wear and absorbed residues from these vessels.

I observed wear on 16 saucers, nine of which had traces on their interiors (Appendix F , Table 10). This includes seven small to medium ( $2-6 \mathrm{~mm} \times 1-5 \mathrm{~mm}$ ) spalls on interior bases from utensils or teacups striking the vessels. Fatigue wear also occurred on interior walls, although these are larger (11-12mm x $4-6 \mathrm{~mm}$ ) and more irregular than the basal wear. There were also 14 small to medium ( $1-4 \mathrm{~mm} \times 1-2 \mathrm{~mm}$ ) ovaloid and irregular abrasive striations on the interior walls, seven of which are oriented vertically and likely came from dragging utensils up and down the walls. Utensils hitting the rim left six abrasions and one fatigue spall. Spalling on the exterior of rims was also observed. Exterior wear on the base and walls were mostly small to medium (1$5 \mathrm{~mm} \times 1-3 \mathrm{~mm}$ ) spalling from the saucers being handled. Three areas of abrasive wear were seen on the foot rings, along with one fatigue spall, likely from the vessels being picked up and set down. I observed wear marks on 14 teacups, seven of which had interior wear (Appendix F, Table 11). Twelve small ( $1-2 \mathrm{~mm} \times 1 \mathrm{~mm}$ ) and two large ( $9-12 \mathrm{~mm} \times 7 \mathrm{~mm}$ ) horizontal ovaloid and linear abrasions were identified on the interior walls, along with one medium-sized ( 4 mm x 2 mm ) fatigue spall, all of which are from utensils hitting the cups. One fatigue spall and one abrasive striation were also present on vessels' rims. Eight small to large ( $1-9 \mathrm{~mm} \times 1-4 \mathrm{~mm}$ ) fatigue spalls were also seen on the exterior walls.

Table 19. Food residues from saucers. Peak values are in cm-1.

More saucers have interior wear than teacups ( $23.68 \%$ vs. $13.72 \%$ ), and saucer sherds are more likely to have these traces than teacup sherds ( $16.96 \%$ vs. $10.25 \%$ ). This suggests that enslaved people used saucers and teacups differently. The saucers' vertical abrasive wear likely came from scooping food upwards out of the vessels since they cannot be explained by stirring liquids or placing teacups into saucers, suggesting that enslaved people at Quarter Site B used saucers for eating, The FTIR data further supports this. I analyzed six saucers and three had peaks associated with food (Table 19). Vessel 1.034 had a peak at $1243 \mathrm{~cm}-1$ corresponding with meat, starches, and tea, making it difficult to interpret. Vessel 1.055 had a peak at $882 \mathrm{~cm}-1$ corresponding with arabinogalactan (a compound found in flowering plants), green tea leaves, and starch, so we can only say the saucer held some kind of plant matter. Vessel 1.063 had peaks at $2129 \mathrm{~cm}-1$ corresponding with isothiocyanate and $2108 \mathrm{~cm}-1$ corresponding with isothiocyanate and onions. Isothiocyanate is a compound found in greens, especially in cruciferous vegetables (Vanderpas 2003), indicating that greens and possibly foods cooked with
onions were eaten from this saucer. While we cannot say that enslaved people used all 38 identified saucers as tablewares, it seems that many were.

Teacups, alternatively, show little evidence of being used as tablewares, as they have the least internal wear of all imported ceramics. Most of this wear is small horizontal abrasions from utensils briefly interacting with cups' walls, a type of wear we would expect to see if the contents of these vessels were stirred since stirring can lead to utensils briefly hitting or rubbing against vessels' walls. This suggests that enslaved people used teacups to consume drinks that required stirring, such as stirring milk/cream or sugar into tea or coffee. This is not to say that teacups were only used for drinking, as two other vessels have large abrasive wear similar to the mugs, suggesting that some may have been used as tablewares even if most were not used this way. Unfortunately, the FTIR data did not provide any definitive evidence we can use for our interpretations of teacups. I analyzed four teacups, but only Vessel 2.096 (R052) had a peak from food or beverages. This peak was located at $2199 \mathrm{~cm}-1$ corresponding with boiled cornmeal (2206-2193 cm-1) and parched corn coffee (2202-2199 cm-1), suggesting it held either parched corn coffee or boiled cornmeal. While the bulk of the use-wear data suggests the former, this sample is from a larger abrasive striation so we cannot rule out boiled cornmeal.

Before moving on, we need to briefly discuss the lack of definitive FTIR evidence for tea or coffee. With residue analysis, a lack of evidence for certain types of molecules does not mean that vessels did not hold these substances (Barnard and Eerkens 2017; Evershed 1993). Evidence for tea could be present in all the tea wares and still be absent in the small portions I tested. We also do not know if/how tea and coffee residues degrade over time (e.g., Evershed 1993; 2008b; Evershed et al. 1995; Regert et al. 1998), so I might be missing important data for identifying centuries-old residues. Additionally, many enslaved people drank coffee substitutes (chicory,

Figure 31. Enslaved woman serving rye coffee at Bell Plantation, Clarke County, 1864. Image from Taylor (1989, 82).
parched corn or rye, etc.) and/or herbal teas (e.g., Covey and Eisnach 2009; Northup 1853)
(Figure 31). The reference library includes parched corn coffee, but I could not get samples of these other beverages, so we cannot tell if they are present. Therefore, we should focus on substances we have data for instead of those we do not.

## (Re)Assembling Imported Ceramics

Ceramics, especially tea wares, played an important role in creating and enacting the ways of being human $18^{\text {th }}$ - and $19^{\text {th }}$-century White Americans claimed for themselves, as using vessels correctly showed that one understood and could perform "proper" ways of eating or taking tea in a variety of settings (e.g., Bedell and Scharfenberger 2000; Deetz 1996; Fromer 2008; Hodge 2009; Wall 1991; Woods 2019; Yentsch 2011). Using ceramics in "authorized" ways could also be important for Indigenous people and late-19 ${ }^{\text {th }}$-century Black Americans, as laying claim to racialized forms of humanity associated with tea and tablewares was one strategy
for navigating the anti-Black settler-colonial worlds they inhabited (e.g., Y. Marshall and Maas 1997; Mullins 1999; Pezzarossi 2014; Warner 1998). In other words, imported ceramics were deeply entangled with liberal humanism and the ontological border wars fought over who counted as (fully) human (see Chapter 3).

Use-wear and residues at Quarter Site B, however, suggest that enslaved Shenandoahans were not using imported ceramics to grasp onto the homo rationalius of their enslavers but reconceptualizing these vessels, "transgress[ing] that technology's designed function and dominate meaning" by using mugs, teacups, and saucers to eat food (Fouché 2006a, 642; also see de Certeau 1984; D. Miller 1987). These women and men were not doing this out of ignorance. Given Quarter Site B's proximity to the manor house, the people living at the site almost certainly knew someone who did domestic work for the Hites and could have told them how the Hites used teawares, if they themselves had not done so at some point in their lives and personally seen the Hites use these vessels. And yet, the evidence from Quarter Site B shows that instead of using vessels in the same ways, they rejected the ways of eating and taking tea that the Hites observed, and instead creatively reconceptualized how ceramics should be used. Doing so may have allowed enslaved women and men to redress some of the pain and suffering the Hites inflicted on them, and in the process create new ways of being human that lay outside of liberal humanism. To see why tea wares, in particular, may have been used in this way, we need to follow some of the assemblages imported ceramics moved through as they went from being commodities in stores to things enslaved Shenandoahans used in their everyday lives. A good place to start with this is the relative cost of different ceramics.

Archaeologists often use George Millers CC Index (1980; 1991) to rank the relative cost of British refined earthenwares based on their decorations, with undecorated common creamware

Table 20. Comparative cost of bowls, cups and saucers, and mugs in merchants' ledgers. All entries for cups and saucers are for full lets of six cups and six saucers. Data available in Appendix F Table, 12.

| Years | Type | Number Sold | Number <br> with Price | Price Range | Mean Price | Mode Price | Mean Price <br> per Vessel |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: |

|  | Cups and Saucers | 11 | 1 | $\$ 0.25$ to $\$ 0.75$ | $\$ 0.533$ | $\$ 0.625$ | $\$ 0.044$ |
|  | Mugs | 4 | 4 | $\$ 0.125$ | $\$ 0.125$ | $\$ 0.125$ | $\$ 0.125$ |

being the cheapest vessels, followed by minimally decorated wares (edged plates and dipted/annular hollowwares), then hand-painted vessels, and finally transfer-printed tablewares and tea settings. The Quarter Site B tea wares are mostly hand-painted (66.99\%), although some are transfer-printed (17.47\%) or common creamware (1.94\%), suggesting that enslaved people used costlier cups and saucers as tablewares instead of common creamware or dipt bowls. However, merchants' ledgers from the Valley (see Chapter 7) tell a different story. While ledgers rarely list decorations, they do provide the cost of various vessel forms (Table 20), which Miller does not assess (Appendix F, Table 12). Unsurprisingly, individual bowls and mugs cost less than sets of teacups and saucers. But these sets included 12 vessels (six teacups and six saucers), and on a per vessel basis, teacups and saucers were cheaper than mugs or bowls. For instance, common creamware bowls cost $\$ 0.0625$ in 1843 - the same price as the most expensive teacup or saucer sold in the 1840s. Non-ceramic drinking vessels were also available, but data on 171 tin cups and 90 glass cups (Table 21) indicates that ceramic cups and saucers generally cost less (Appendix F, Table 13). As a result, enslaved women and men at Belle Grove were not necessarily seeking to acquire expensive tea wares but selecting the cheapest possible vessel that could function as a bowl. Other factors are invariably involved here, and we should not reduce

Table 21. Price of glass and tin cups in the merchants' ledgers. Data available in Appendix F, Table 13.

| $1795-1800$ | Wine Glass | 16 | 9 d to 23.83 d | 12.95 d | 9.5 d |
| $1841-1849$ | Glass Tumbler | 36 | 0.0625 to $\$ 0.1875$ | $\$ 0.093$ | $\$ 0.063$ |
| $1841-1849$ | Glasses | 10 | $\$ 0.043$ to $\$ 0.083$ | $\$ 0.066$ | $\$ 0.066$ |
| $1841-1849$ | Tin Cups | 23 | $\$ 0.04$ to $\$ .0625$ | $\$ 0.060$ | $\$ 0.063$ |
| $1850-1862$ | Tin Cups | 43 | $\$ 0.03$ to $\$ 0.0625$ | $\$ 0.057$ | $\$ 0.063$ |

these choices down to mere economics, but the low cost of teacups and saucers probably influenced enslaved people's choices about what types of vessels to get from cities, towns, and country stores. And the relatively low cost of tea wares may have allowed them to shape enslaved life in various ways.

In addition to being the cheapest hollowwares sold in the Valley, teacups and saucers would have been the cheapest decorated ceramics available, since even undecorated common creamware bowls cost more than most (presumably decorated) cups and saucers. These decorations varied widely, with the 103 tea wares from Quarter Site B belonging to 43 different vessel sets with hand-painted motifs in polychrome earth tones, bright tones, and chrome colors, monochrome blue and green designs, and blue, black, brown, and purple transfer prints. This amount of variation makes tea wares the most visually diverse ceramic category at Quarter Site B. Furthermore, there is a lot of variation in tea wares throughout the site, with $65.11 \%$ of teaware vessel sets being found in just one midden or possible house site. This variation could have important effects, creating individual aesthetic styles associated with different households (Aniakor 1996; Wilkie and Farnsworth 2005, 280-88).

As mentioned in earlier chapters, notions of fungibility and the interchangeability of Black women and men were important components of enslaving assemblages (e.g., Hartman 1997; T. L. King 2019; Spillers 1987). These logics operated, in part, through food, with

Table 22. Comparative statistics on enslaved and White transactions in merchants' ledgers that include hot beverages. Data for enslaved consumers in Appendix E, Table 1. Data for White consumers in Appendix F, Table 14.

|  | Enslaved <br> $(1795-1806)$ | Enslaved <br> $(1838-1862)$ | White <br> $(1795-1806)$ | White <br> $(1838-1862)$ |

enslavers arguing that a single, set amount of cornmeal and salted pork satisfied every enslaved people's dietary needs. In response, enslaved people redefined their humanities by growing extra corn, gathering nuts and wild fruit, hunting rabbits and squirrels, raising fowl, and distributing these within kin networks based on their own understanding of how much food different people needed (see Chapter 6). Eating this food from decorated tea wares that differed from household to household allowed the (relative) uniqueness of these decorations to further differentiate enslaved people, chipping away at notions of fungibility that defined enslavers' conception of Black humanity.

Our evidence suggests that enslaved people used most teacups and mugs to consume beverages. We cannot prove that this included tea or coffee, but the small abrasions in teacups from stirring, along with three imported and one locally-made teapot from Quarter Site B, suggest that this was the case. Merchants' ledgers show enslaved Shenandoahans buying coffee $(n=26)$, tea $(n=9)$, and drinking chocolate $(n=4)$ (Appendix E, Table 1). Comparing these to 2,346 purchases of coffee, tea, and drinking chocolate made by White Shenandoahans (Appendix F, Table 14) shows some similar trends. Throughout the $19^{\text {th }}$ century, Shenandoahans bought hot beverages more often and increasingly selected coffee over tea or chocolate (Table 22). What sets enslaved consumers apart is when they bought these drinks. For most of the year, white consumers bought coffee, tea, or drinking chocolate in $10.3 \%$ of their transactions, although this increased to $16.3 \%$ in May and June (Figure 32). This pattern fits with people using tea, coffee,

Figure 32. Percentage of purchases in merchants'ledgers including hot beverages (coffee, drinking chocolate, or tea). Data for enslaved consumers in Appendix E, Table 1. Data for White consumers in Appendix F, Table 14.
and vessels associated with them to performatively lay claim to the "rational" forms of humanity White Americans saw themselves as inhabiting, as these enactments needed to take place throughout the year.

Enslaved consumers, alternatively, preferred buying hot beverages in the colder months, with $65.78 \%$ of purchases occurring between November and February. On average, $14.4 \%$ of enslaved transactions in November through February included hot beverages, followed by 5.8\% of transactions between June and August, and just $1.6 \%$ of transactions in March through May and September through October. This suggests that instead of using hot beverages to enact ways of being human associated with liberal humanism, other effects of consuming tea, coffee, and drinking chocolate may have been more important to enslaved people, like the way a steaming hot cup of tea helped an enslaved woman thaw out her hands after a day of mending fences in January or the energy a cup of coffee gave her in August when she needed to tend her garden at
night after a long day of working under the hot Virginia sun. Having affordable vessels, like teacups, to drink these beverages from may have been important for redressing some of the pain and suffering of slavery, and this could have been one of the reasons enslaved women and men chose to acquire tea wares.

Regardless of why, exactly, enslaved people at Quarter Site B acquired teacups and saucers, these vessels seem to have allowed enslaved people to build lives for themselves in multiple ways. As a result, tea wares are not only the most common ceramic type at the site but a type that enslaved people regularly acquired on their own. And this decision to acquire teacups and saucers repeated throughout time. Enslaved people at Quarter Site B acquired fewer ceramic plates, mugs, and bowls for themselves from local merchants throughout the $19^{\text {th }}$ century, as $60.00 \%$ of pearlware vessels (pre-1830) are from vessels sets that are not found at the manor house, while only $33.33 \%$ of whiteware vessels (post-1820) seem to have been acquired by enslaved people on their own (see Chapter 7). Yet, they continued to acquire tea wares from cities, towns, and country stores at roughly the same rate throughout this time, as $61.22 \%$ of pearlware tea wares and $59.09 \%$ of whiteware tea wares are from sets that are not associated with the manor house. However, imported tea and tablewares were not the only ceramics that enslaved people used to make lives for themselves, and in the following chapter, we consider how the women and men at Quarter Site B used locally-made utilitarian vessels.

## Chapter 9: Locally-Made Utilitarian Ceramics

On 11 September 1856, an unnamed enslaved woman bought two locally-made ceramic crocks from the Homer and Nelson store in Back Creek, Virginia (Homer and Nelson 1858, 24). Unfortunately, we know nothing about this woman aside from the fact that she bought the crocks, along with an ounce of cinnamon, on Robert Smith's account. The inclusion of a crock in an illustration of an enslaved home in John Kennedy's Swallow Barn (1853), a novel based on Kennedy's experience visiting his family's Shenandoah Valley plantation (Figure 33), and dozens of crocks and other locally-made utilitarian vessels found at Quarter Site B suggest that her decision to buy these ceramics was not unusual. In fact, it seems to be something enslaved Shenandoahans did on a somewhat regular basis. This means that even if we do not know who the nameless enslaved woman was, we can use data from other parts of the Shenandoah Valley to tease out the poetics of her act of consumption - the people, things, and political economies she assembled when buying the crocks and the friction generated when these components rubbed against one another.

Exploring these poetics is important for studying enslaved life in the Shenandoah Valley. In the $18^{\text {th }}$ and $19^{\text {th }}$ centuries, the Valley had a particularly robust ceramic industry. For many Shenandoahans, using locally-made vessels to prepare, store, and eat food was an important part of everyday life. In the early $20^{\text {th }}$ century, collectors began noticing these mundane vessels, seeing in them a "particular beauty and charm" that transformed locally-made ceramics into one of the most iconic components of the region's history (Comstock 1994a; Evans and Suter 2004; A. H. Rice and Stoudt 1929, 1). When discussing locally-made ceramics, scholars and collectors

Figure 33. Illustration of Luke and Lucy from Swallow Barn, with crock in the bottom left corner. Illustration by Strother.
describe them as the singular possession of white Shenandoahans, treating local pots as things made by the descendants of German (and occasionally Scots-Irish) immigrants for the descendants of German and Scots-Irish immigrants (e.g., Comstock 1994a; Fennell 2017; Jolley 2004; A. H. Rice and Stoudt 1929; Russ 1995; 1999; Russ and McDaniel 1991b). Yet Black men worked in local potteries, and Black customers bought and used locally-made ceramics. This chapter attempts to crack open the tightly bound set of associations between local ceramics and whiteness to create new histories that recognize the contributions enslaved people made to the local ceramic industry and the ways locally-made ceramics shaped enslaved life.

Figure 34. Selection of locally-made ceramics from Quarter Site B, Belle Grove Plantation.

Archaeologists often note that enslaved Southerners used glazed utilitarian ceramics to process and store food (e.g., Wilkie 2000a). But they do not connect these vessels to specific foods, nor do they assess how these vessels affected other aspects of enslaved life. This is partly because few sites yield enough data to thoroughly explore these connections and partly because most archaeologists do not seem to consider them ceramics to be as interesting as imported tablewares. Quarter Site B has one of the largest collections of glazed utilitarian ceramics from the American South, with 3,909 sherds and at least 173 identified vessels, giving us a robust
collection for assessing these ceramics (Figure 34). This chapter looks at the political-economic effects of enslaved people's decisions to acquire locally-made utilitarian ceramics by comparing their consumption practices to those of white Shenandoahans. Based on the Belle Grove ceramics, the average enslaved woman or man in the Valley likely acquired as many vessels as the average white Shenandoahan, suggesting that enslaved people had the same economic impact on the local ceramic industry as white consumers. Next, we will talk about what enslaved people did with the ceramics once they brought them home. Combining use-wear and residue analyses (see Chapter 8) shows us that enslaved women and men used crocks and jars to store food like preserves and pickled meat, repurposed pans as cooking vessels, and kept liquids like water or molasses in jugs. Being able to store food was important for enslaved people's ability to redress the gastronomic violence enslavers inflicted on them through inadequate rations of cornmeal and salted pork (see Chapter 6), allowing enslaved people to have more to eat during the winter and early spring when other sources of food were not readily available. But first, we need to introduce Valley ceramics and the often-ignored stories of Free Black and enslaved potters. Making Pots

The first generation of colonizers in the Shenandoah Valley relied on ceramics imported into the region from the eastern seaboard, especially from Philadelphia. However, in 1745 potters established workshops in Hagerstown, Maryland, selling their wares southward into the Valley. In the 1760s some Hagerstown potters moved into the Valley, establishing an important local industry that supplied nearly every household in the region with utilitarian ceramics for over 100 years (Comstock 1994a). The first two potteries in the northern Valley opened in the 1770s, and by the 1810 s-1850s eight to 10 workshops operated in the region at any given time (Figure 35).

|  | 1770 s | 1780 s | 1790 s | 1800 s | 1810 s | 1820 s | 1830 s | 1840 s | 1850 s |

Figure 35. Northern Shenandoah Valley Potters in Space and Time. This chart does not include Peter Sipple, as the location of his 1846-1854 Shenandoah County kiln is unknown.

Aside from Newtown and Shepherdstown, which had three and four potteries (respectively), most towns had only one or two workshops. In the 1840s and 1850s, however, four to five workshops operated in Strasburg (over $40 \%$ of all northern Valley potteries), making it the dominant production center in the region.

Local potters made both lead-glazed utilitarian coarse earthenware and salt-glazed stoneware utilitarian vessels, with crocks, jars, and jugs being the most common forms. Before the mid- $19^{\text {th }}$ century, most potters made earthenwares. However, in response to new concerns about lead poisoning raised by Valley consumers in the 1850s, potters focused primarily on stoneware production for the remainder of the century (Comstock 1994a, 15-16). Potters also made an array of earthenware tablewares (dishes, bowls, pitchers, etc.), decorating many with black painted or black, white, red, or green slipped motifs, but these were rarely made after the early-19 ${ }^{\text {th }}$ century (Comstock 1994a, 17).

German immigrants trained most local potters, and potters of German descent owned 19 of the 21 workshops in the northern Valley (Comstock 1994a). Not surprisingly, Valley ceramics are strongly influenced by Germanic traditions. However, Black men also worked in Valley potteries. H.E. Comstock (1994a) notes two free Black potters in the region, with William Moore
potting from 1826 to 1860 in Woodstock and Strasburg, and Abraham Spencer working in Strasburg, Middletown, and Rockingham County from as early as the 1830s into the 1880s (also see Hornsby Heindl 2020). Census documents suggest other Black men worked as potters, as at least eight potters were enslavers (US Bureau of the Census 1810a; 1810b; 1820a; 1820b; 1830a; 1830b; 1840c; 1840f; 1850d; 1850e; 1860c; 1860d), with three enslaving teenage boys or men those people most likely to work in potteries (Comstock 1994a, 355-499). Andrew Pitman enslaved three men from the 1810s to the 1830s, his brother John Pitman enslaved one man during the 1820 s, and Henry Keister enslaved one man during the 1850s and 1860s. Meanwhile, at least six shop owners had Free Black people listed in their households, four of whom housed Black men and teenage boys (Andrew Pitman, Peter Lauck, Mathias Sommers, and Samuel Sommers). While these records place Black men in the households of potters in Strasburg (Keister), Winchester (Lauck), and Woodstock (Mathias and Samuel Sommers), about half of these individuals (55.55\%) lived in Newtown, including $60 \%$ of enslaved men and teenage boys.

Previous discussions of the men enslaved by Valley potters dismissed their contributions by claiming, without evidence, that they were merely "cheap help around the shop" (Comstock 1994, 16). However, even if enslaved people only helped around the shop, we cannot discount the work they performed. Their labor and their skills contributed to the Valley's ceramic industry and enriched the men who enslaved them. This is especially true when we consider vessels made in Andrew Pitman's workshop, as $44.44 \%$ of the possible Black potters listed in the census records (three enslaved people and a free Black man) may have worked in his pottery.

## Acquiring Pots

The history of Shenandoah Valley ceramics is not just about potters. It is also about the women and men who bought their wares (Greer and MacDonald 2020, 159). In his study of
consumption practices in the upper Potomac and northern Shenandoah Valleys, Christopher Fennell (2017) argues that interactions between consumers and locally-made ceramics produced local identities. Eighteenth and early-19 ${ }^{\text {th }}$-century merchants from outside the Valley flooded the region with cheap imported ceramics. Yet Fennell's data demonstrates that Shenandoahans preferred buying locally-made vessels. While consumers throughout the mid-Atlantic bought locally-made vessels (Bloch 2016), Valley consumers stand out for the amount of locally-made ceramics they acquired. Sherds from locally-made earthenwares comprise roughly a third of the ceramics recovered from $18^{\text {th }}$ - and early- $19^{\text {th }}$-century sites in the Valley, most of which are utilitarian vessels (Fennell 2017, 161-78). ${ }^{81}$

Fennell specifically argues that Shenandoahans performed German-American identities when they bought and used local German-style ceramics. The merchants' ledgers Fennell (2003, Appendix B) uses to make this argument, however, include people of German, Scots-Irish, and English descent, and the consumption practices he identifies extend to all three ethnic groups. Therefore, the identities Fennell describes are not necessarily ethnicity-based, but race- and place-based, with buying and using locally-made ceramics creating shared sociomaterial worlds inhabited by white Shenandoahans of various ancestry. Regardless of the identities in question, this connection between consumers and local vessels provides a powerful way to theorize the effects that radiated out from the ways German/white Shenandoahans selected and used ceramics. These consumption practices also supported local potteries, with the high demand for locally-made vessels allowing the Shenandoah Valley's ceramic industry to thrive. However, as enslaved Shenandoahans also bought local ceramics, so we must also ask what effect their consumption practices had.

[^66]As noted in Chapter 7, the locally-made utilitarian ceramics from Quarter Site B are primarily, if not exclusively, vessels enslaved people bought for themselves. Furthermore, the Hites probably did not distribute these to enslaved people because they would not have considered these to be something enslaved women and men needed, making it unlikely that these vessels were issued by the Hites. This is because the utilitarian forms we identified at the site (crocks, jars, jugs, and pans) would not have been needed to store or prepare rations of cornmeal or salted pork. Of the 11,092 ceramic sherds from Quarter Site B at Belle Grove Plantation, 3,507 (31.61\%) are coarse earthenwares. This is in line with the average percentage Fennell provides for white consumers, suggesting that the people enslaved at Quarter Site B acquired the same percentage of locally-made earthenwares as white Shenandoahans. Unfortunately, Quarter Site B is the only early- $19^{\text {th }}$-century quarter site in the northern Valley that has been excavated, so we cannot compare these numbers to other sites. If, however, Quarter Site B's ceramics are indicative of the consumption practices of other enslaved Shenandoahans, then the enslaved were just as likely to buy locally-made ceramics as white consumers. In other words, the average enslaved consumer may have affected the local ceramic industry through their decision to acquire coarse earthenwares in the same way as the average white consumer. As discussed in more detail in the following section, enslaved consumers at Quarter Site B were 2.3 times more likely to buy jugs and 18.9 times more likely to buy pans than white consumers. This may have increased the demand for these forms, potentially leading local potters to make more jugs and pans to accommodate enslaved consumers' needs and desires.

To reinforce these points, let us consider a single vessel and the potter who made it. Vessel 3.039 is a coarse earthenware crock or pan (Figure 36). While lifting the vessel off the potter's wheel, the man who made it left his fingerprints impressed in the damp clay. This vessel

Figure 36. Coarse Earthenware Sherd with Fingerprints (Vessel 3.039). The bottom of the vessel is at the top of the image. Photograph by Erica G. Moses.
is one of seven locally-made vessels from Quarter Site B with fingerprints on them, but it stands out for the quality of its prints. Their crispness grabs our attention, serving as a forceful reminder that when we talk about locally-made ceramics we are not just discussing an industry. We are also discussing potters, people whose livelihoods depended on their ability to make and sell ceramics. While we do not know the name of the potter, we know that his ability to make a living depended, at least in part, on an enslaved consumer from Quarter Site B who chose to acquire a vessel he made.

If buying and using locally-made ceramics (re)produced German and/or white identities, then the local ceramic industry was part of the broader assemblage through which these identities emerged. Because enslaved people contributed to this industry, their actions affected how local identities emerged and operated by helping to create the conditions that allowed certain groups of Shenandoahans to perform Germanness and/or whiteness, even if enslaved women and men were themselves barred from these identities and the forms of humanity associated with them, even if they wanted to claim these identities and ways of being human for themselves.

## Using Pots

How did enslaved Shenandoahans use the locally-made utilitarian wares they acquired? How did these vessels allow enslaved women and men to create lives for themselves within the confines of slavery? Answering these questions requires assessing use-wear and absorbed residues from the three main types of utilitarian wares found at Quarter Site B: crocks/jars, pans, and jugs. To gain further insight into how enslaved people used these vessels, I juxtapose the archaeological data against 232 transactions in merchants' ledgers (see Chapter 7 for a complete list of ledgers) and 64 transactions from Peter Bell's Hagerstown, Maryland pottery (Comstock 1994a, 505-8) that record the purchase of 638 locally-made utilitarian ceramics by white Shenandoahans (Appendix G, Table 1).

A minimum vessel analysis of Quarter Site B's locally-made ceramics (see Chapter 7) identified 173 coarse earthenware and stoneware utilitarian vessels (Table 23). I could only identify the specific form of 68 vessels, including 39 crocks or jars, 16 pans, 12 jugs, and one lid. ${ }^{82}$ All utilitarian wares included in a neutron activation analysis of 100 coarse earthenware and stoneware vessels from Quarter Site B were found to be from the Valley (Greer and

[^67]Table 23. Locally-made utilitarian wares from Quarter Site B, by vessel form and ceramic type.

| Vessel Form | Coarse Earthenware | Stoneware | Total |
| :--- | :---: | :---: | :---: |
| Crock | 13 | 4 | 17 |
| Crock or Jar | 19 | 2 | 21 |

| Crock or Pan | 2 | 0 | 2 |

MacDonald 2020, also see Chapter 7), so we can safely assume that most (if not all) utilitarian
vessels from Quarter Site B are locally made. Therefore, to talk about how utilitarian ceramics affected enslaved life in the Shenandoah Valley is to talk about the interaction between enslaved people and locally-made vessels.

I inspected every utilitarian vessel identified in the minimum vessel analysis for use-wear following the procedures outlined in Chapter 8. In doing this I identified 212 areas on 53 vessels that could be analyzed for absorbed residues using Fourier transform infrared spectroscopy (FTIR). Of these, I analyzed 48 locations on 33 vessels, along with an additional control sample from each vessel, using the procedures discussed in Chapter 8 (Table 24). I identified 3,848 peaks from the FTIR runs and removed 3,436 peaks from 31 commonly occurring peak ranges that are likely from the extraction solution, the microscope slide, surface contamination, and/or portions of the ceramic body suspended in the extraction solution from the dataset (Appendix G, Tables 2-4)..$^{83}$ I further refined this data by removing peaks that are within $5 \mathrm{~cm}-1$ of peaks associated with control samples from the 33 locally-made utilitarian vessels, five locally-made

tablewares, and 20 imported tablewares (see Chapter 8), leaving me with 12 analyzable peaks from eight vessels (Appendix G, Table 5).

## Crocks and Jars

Crocks and jars are tall, cylindrical storage vessels, with the major difference between the two being their rim diameters (Comstock 1994a, 69-72; Ketchum 1991a, 32). The rim of a crock is as wide, or wider, than the diameter of its base, while the rim of a jar is smaller than its base. Because of these forms' similarities, it was difficult to differentiate them, hence the combined category of crock/jar. Crocks and jars are the most common utilitarian ware at Quarter Site B ( $55.40 \%$ ) and in the ledgers $(91.69 \%) .{ }^{84}$ These vessels are primarily used for storing food (especially pickles, preserves, and butter), letting Shenandoahans preserve fruits, vegetables, and dairy products year-round. White Shenandoahans bought $63.24 \%$ of their crocks and jars, including all vessels identified as pickling jars/pots, between July and October, the time of year when most people were likely preserving produce in preparation for winter and early spring (e.g., I. Hite 1847, 184-87).

I observed wear on 22 crocks/jars (Appendix G, Table 6). Most (80.37\%) wear marks were on vessels' interiors, the most common of which ( $\mathrm{n}=35$ ) were narrow ( 1 mm ) horizontal linear abrasions running along interior walls. Laura Banducci (2014) and James Skibo (1992) note that such wear often comes from scrubbing vessels with abrasive substances (sand, wheat/rice chaff, etc.) to clean them, and this may be the case here. Other wear on the interior walls includes small to large ( $1-12 \mathrm{~mm} \times 1-5 \mathrm{~mm}$ ) horizontal $(\mathrm{n}=12)$, indeterminate $(\mathrm{n}=10)$, and vertical ( $\mathrm{n}=1$ ) ovaloid abrasive striations, narrow ( $1-2 \mathrm{~mm}$ wide) diagonal linear abrasions ( $\mathrm{n}=6$ ), an abrasive patch, and two large ( $8-9 \mathrm{~mm} \times 7 \mathrm{~mm}$ ) fatigue spalls. Medium to large ( $3-8 \mathrm{~mm} \times 1-$ 5 mm ) abrasive striations ( $\mathrm{n}=7$ ) and an abrasive patch were also located on the interior bases of two vessels. The large amount of abrasive wear suggests that these vessels routinely had their

[^69]contents stirred within, or scraped out of, them. A mixture of fatigue spalls ( $n=4$ ) and abrasive striations $(\mathrm{n}=4)$ and patches $(\mathrm{n}=1)$ were present on the interior rims, most likely from placing lids onto, and removing lids from, these vessels. Similar wear was present on the exterior rims (six abrasions and six spalls), along with abrasive wear on foot rings ( $n=2$ ), and a mixture of spalls $(\mathrm{n}=2)$ and abrasions $(\mathrm{n}=5)$ on exterior walls. The combined wear suggests that crocks and jars were used for their intended purpose of storing preserved foods, as the interior wear is consistent with people stirring food (possibly while preparing it to be preserved) and/or taking food out of the vessels, while the rim wear suggests that lids were placed on these vessels. The relative lack of exterior wear also fits with this interpretation, as storage containers are not handled regularly but placed out of the way for weeks if not months at a time until people pull them out to remove food from them.

The FTIR data supports this interpretation and sheds some light on the types of food enslaved people at Quarter Site B preserved in crocks and jars. Seven crocks/jars were analyzed by FTIR and four had peaks associated with food (Table 25). Vessel 1.155 has peaks at $2478 \mathrm{~cm}-$ 1 corresponding to steeped black tea (although this is unlikely to be the substance that caused this peak), $1937 \mathrm{~cm}-1$ that does not correspond to anything in the reference library, and $2401 \mathrm{~cm}-$ 1 corresponding to saltpeter (potassium nitrate), which is used in preserving meat. Multiple references exist to enslaved Southerners pickling beef, pork, and venison (Covey and Eisnach $2009,101,233,241,252)$ and the merchants' ledgers contain two entries for enslaved men buying saltpeter (Account Book 2 1797), so it is quite likely that enslaved people at Quarter Site B were pickling meat in crocks/jars to preserve it. Vessel 2.035 has a peak at $598 \mathrm{~cm}-1$ corresponding with blackberries and cucumbers, suggesting that it held pickles or preserves/jam, both of which enslaved southerners made to store food (Covey and Eisnach 2009, 266, 276-78).

Table 25. Peaks from crocks and/or jars associated with food.

| Vessel | Run | Location | Wear Mechanism | Trace | Peak | Likely Source |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1.155 | R077-1-B2 | Wall | Abrasive | Patch | 2478 | Black tea (2475) |
|  |  |  |  |  | 2401 <br> 1937 | Potassium nitrate (2399) |
| Indeterminate |  |  |  |  |  |  |

Vessel 3.031 had a peak at $1420 \mathrm{~cm}-1$ corresponding to a wide assortment of foods, preventing us from narrowing down what was stored in this vessel. Vessel 7.019 had a peak at $2583 \mathrm{~cm}-1$ corresponding to thiol, an organosulfur compound found in a variety of plant- and animal-based foods, making it impossible to associate this peak with any one type of food.

Seventy-six percent of the crocks from Quarter Site B are lead-glazed coarse earthenwares, with the rest being stonewares. This likely resulted from a combination of the selections available in the region, the relative costs of stoneware and earthenware, and enslaved
people's needs. The Homer and Nelson store in Back Creek sold two stoneware and 12 earthenware jars between 1849 and 1858. The stoneware jars cost $\$ 0.375$ each, while the average earthenware jar cost $\$ 0.198$ ( $\$ 11.30$ vs. $\$ 5.65$ in 2020, respectively) (Homer and Nelson 1851, $41,42,208,209,223 ; 1858,32,56,67)$. Clays used to make stonewares have more silica which vitrifies and fuses when fired at over $1,200^{\circ} \mathrm{C}$ to create denser, more durable vessels (Comstock 1994a, 65-66). Investing in stoneware vessels could be beneficial if consumers needed crocks/jars that could withstand more wear and tear. However, if enslaved people at Quarter Site B only used crocks and jars to store food, they were not handling them very often, reducing the benefit of acquiring expensive stonewares. This may have led enslaved consumers to consider stoneware an unnecessary expense, accounting for the preponderance of earthenware storage vessels.

## Pans

Pans are wide, shallow vessels with outwardly sloping sides, giving them a large rim diameter (Ketchum 1991a, 28). These vessels are mostly used for processing food, especially separating cream from fresh milk. The ledgers only list white Shenandoahans buying eight pans, accounting for $1.25 \%$ of the utilitarian wares. Tin pans replaced ceramic vessels in much of the United States by the mid-19 th century, providing a more durable, "lighter, and easier to clean" alternative at an equivalent price (\$0.25 each in 1850) (Homer and Nelson 1851, 81, 192; Ketchum 1991b, 28). Valley merchants sold tin pans in the 1790s, so these may have replaced ceramic pans in the late- $18^{\text {th }}$ century. In his classic study on Valley ceramics, H.E. Comstock (1994a) notes that local potters made pans, but he does not include pans in his introductory remarks on the typical forms made in the region, furthering the impression that these vessels were not commonly purchased in the Valley.

Despite this, pans account for $21.62 \%$ of the utilitarian vessels from Quarter Site B. The use-wear and FTIR analyses suggest three possible ways that enslaved women and men at Quarter Site B used pans (Appendix G, Table 7). Most (62.5\%) pans lack observable wear, suggesting that they were used in ways that did not mar their surfaces. As a result, I could not test these for absorbed residues, since my samples need to come from areas where the glaze chipped away, allowing food/beverage to seep into ceramics' porous bodies. Processing dairy is unlikely to leave observable traces on vessels since milk was placed inside and left to rest until cream could be scooped off the top. Several enslaved people in the northern Valley made and sold butter (Milton 1849; Homer and Nelson 1858). For instance, Mary Foster, a woman enslaved at Mount Airy (immediately southeast of the Hites' Long Meadow Track), made eight pounds of butter per week from 42 gallons of milk her cow produced (Foster 1878, 19). We do not know if anyone living at the site had a cow, but if they did the unworn pans could have been used to process milk.

Three pans $(2.026,2.030,3.032)$ have small to large $(2-12 \mathrm{~mm} \times 1-7 \mathrm{~mm})$ abrasive striations running horizontally ( $\mathrm{n}=17$ ) or in indeterminate directions $(\mathrm{n}=6)$ along their interior walls. This suggests that they were used for preparing something other than dairy products since this type of wear is unlikely to be associated with milk pans. Two of these pans were tested for absorbed residues (Table 26), and Vessel 2.026 had a peak at $2634 \mathrm{~cm}-1$, although this could not be matched with any substance in the reference library, preventing us from determining what, exactly, enslaved women and men did with these pans.

Table 26. Peaks from pans associated with food.

| Vessel | Run | Side | Location | Wear Mechanism | Trace | Peak | Likely Source |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2.026 | R066-1-B1 | Interior | Wall | Abrasive | Striation | 2634 | Indeterminate |
| 3.044 | R002-3-B2 | Interior | Wall | Thermal | Charred <br> Encrustation |  |  |
|  |  |  |  |  |  | 2524 | Indeterminate |
|  |  |  |  |  |  |  | Green tea (885- |
|  |  |  |  |  |  | 879 | 870) |
|  |  |  |  |  |  |  | Arabinogalactan (879) |
|  |  |  |  |  |  |  | Cucumber flesh (876-870) |
|  |  |  |  |  |  |  | Egg yolk (874) Polysaccharides (874) |

The remaining three pans have dramatically different use-wear (Figure 37). Vessel 2.017 has discoloration from direct contact with a heat source on its interior ( $\mathrm{n}=6$ ) and exterior $(\mathrm{n}=1)$ walls, along with soot on its exterior ( $\mathrm{n}=1$ ), and three sherds have charred encrustations sitting on top of the interior glaze. Vessel 3.044 also has charred encrustations ( $\mathrm{n}=2$ ) and a soot mark on its exterior wall. Vessel 2.016 has thermal discoloration on its interior walls ( $\mathrm{n}=4$ ) and base ( $\mathrm{n}=1$ ) and soot on its exterior walls ( $n=2$ ) and base ( $n=2$ ). It also has patches of fatigue spalls ( $n=3$ ) and abrasions ( $\mathrm{n}=1$ ) on its interior base and walls from utensils striking and abrading the pan. ${ }^{85}$ Local kilns separated the firebox from the ceramics (Comstock 1994a, 36-40), preventing them from coming into direct contact with heat sources, and none of these three pans were recovered from the burned debris of Cabin 1 making it unlikely the thermal alterations occurred during the manufacturing process or the house fire. Instead, it is more likely that enslaved people at Quarter Site B used these pans as cooking vessels. To determine what kinds of food they cooked in these pans, I analyzed three samples from each vessel using FTIR, and only Vessel 3.044 had peaks

[^70]

Figure 37. Thermal wear on locally-made pans. Photographs by Erica G. Moses.
associated with absorbed residues. However, this included a peak at $2524 \mathrm{~cm}-1$ that could not be matched to any substance in the reference library and another at $879 \mathrm{~cm}-1$ corresponding to a wide assortment of foods. The inability of the FTIR data to identify what was cooked in these pans is probably due to chemical changes that occur when food burns, which destroys many of
the specific compounds that are assessed through residue analysis (Barnard and Eerkens 2017) and should not be taken as evidence that the pans were not used for cooking.

Most enslaved Virginians cooked in cast iron vessels that enslavers issued to them or that they acquired themselves (Account Book 2 1797, 557). The residents of Quarter Site B also used vessels like these, as 19 fragments of cast iron cooking pots have been recovered from the site, including the lid to a large pot or Dutch oven. In contrast to iron pots, ceramic vessels do not heat food as efficiently and crack if they get too hot too quickly (possibly the ultimate fate of the three pans described above), so they need to be used at lower cooking temperatures for longer periods (Bloch 2016, 248; Skibo and Schiffer 2008, 15). James Skibo (2013, 31-36) argues that these differences lead to metal and ceramic pots being used for cooking different types of food. When boiling starches, like the cornmeal that comprised a large portion of enslaved Virginians' diets (e.g., Samford 2007, 127), the goal is to quickly boil water and then let the food simmer until fully cooked. Cast iron pots work better for this, as they can withstand more thermal shock than ceramic pots. When stewing vegetables and meat, on the other hand, the ingredients are generally cooked for a longer amount of time, tenderizing them and allowing flavors to develop. However, longer cooking times increase the possibility of pots boiling over, potentially extinguishing the fire used to cook the food. Here, the reduced heat efficiency of ceramic pots is beneficial, as it drastically reduces the likelihood of pots boiling over even when left unattended. Additionally, Southern cooks considered some food, like okra soup, to be "inferior" if cooked in "any[thing] but an Indian [ceramic] pot" (Randolph, cited in Ferguson 1992, 90). However, none of the other utilitarian forms identified at Quarter Site B have evidence of thermal wear, so it is worth asking why enslaved people specifically used pans as cooking vessels.

Three morphological characteristics of pans make them better suited for cooking than crocks or jars. First, pans have wide rims, with those from Quarter Site B having diameters that range from $26-36 \mathrm{~cm}$, which gave enslaved people room to stir food cooking within them (Skibo 2013, 34). Crocks and jars, on the other hand, have narrower rims, with the rims from Quarter Site B being $14-24 \mathrm{~cm}$ wide, making it difficult to stir their contents. Second, pans have wide bases. The narrowest from Quarter Site B has a diameter of 16 cm , making them relatively stable vessels. Crocks and jars have comparatively narrow bases, with the widest from Quarter Site B being 14 cm in diameter, possibly making them less stable when placed on a bed of uneven coals (Skibo 2013, 32). Finally, pans are around twice as wide as they are tall, whereas crocks and jars are around 1.3 times taller than they are wide (Comstock 1994a, 510-11). Therefore, pans allow more food to come into contact with the heat radiating upward from the vessels' base, letting it cook evenly. The narrowness of crocks and jars, alternatively, would limit the amount of food that came into contact with their bases, making cooking in them less effective without increasing the heat, which risks burning food closer to the bottom and/or cracking the vessel, or constantly stirring, which would have been difficult with their narrow openings.

## Jugs

Like crocks and jars, jugs are tall cylindrical storage vessels, but with narrower, easily plugged openings that keep liquids stored in them from evaporating (Comstock 1994a, 72;

Ketchum 1991a, 30). At $6.89 \%$ of the vessels listed in the ledgers, jugs were the second most common utilitarian ware white Shenandoahans bought. At Quarter Site B, jugs are the third most common utilitarian form, but they account for $16.21 \%$ of the identified vessels. What did these jugs let enslaved people do that made them want to acquire these vessels more often than white consumers did?

No wear patterns on the jugs point to alternative uses, so the site's residents may have only used the vessels for their intended purpose of holding liquid (Appendix G, Table 8), although we cannot rule out alternative uses as may not have left wear marks (e.g., Arjona 2017b, 189-90). Molasses could be stored in jugs and enslaved consumers bought molasses more often than white consumers. Between 1795 and 1806, $3.55 \%$ of transactions in merchants' ledgers involving enslaved people included molasses, with the average consumer buying 0.54 gallons (2.04L). By comparison, $0.59 \%$ of transactions involving white Shenandoahans included molasses, and the average white customer bought 0.50 gallons (1.89L) (Appendix G, Table 9). By 1838-1862 enslaved consumers still bought molasses more often than white consumers ( $10.00 \%$ of transactions vs. $6.73 \%$ ), although they had begun buying less molasses per transaction (0.31 gallons [1.17L] vs. 0.55 gallons [2.08L]). Merchants did not sell pre-packaged molasses, so enslaved consumers needed containers to buy and store this substance. While glass bottles were available, they were less durable and more expensive than ceramic jugs (a one-pint bottle cost 7.5 pence in 1800 while a "small" jug cost 4.5 pence) (Account Book 1800, 76, 123). Therefore, jugs may have allowed enslaved Shenandoahans to buy and store molasses more often than white consumers, and in the process, allowed molasses to play a larger role in enslaved foodways than in the diets of white Shenandoahans in the early- $19^{\text {th }}$ century.

The residents of Quarter Site B could also have used the jugs to store water. The closest known water source to the site is a springhead approximately 150 m downhill. The most direct route to the springhead involves a steep slope (approximately $15^{\circ}$ ), which could be avoided by taking a more indirect route along the plantation's road network, bringing the round trip to around 400 m . Enslaved people worked for hours each day doing arduous agricultural tasks, especially in the summer (see Chapters 5 and 6), and the inhabitants of Quarter Site B may have
found these trips difficult after a day spent toiling in Belle Grove's wheat fields. The women and men at the site may have acquired more jugs than white consumers because these vessels allowed them to keep a supply of water at the site (also see Reeves 2011) that they could refill at times that worked for them.

Two-thirds of the jugs from Quarter Site B are stoneware, making it the only category where stonewares make up more than $25 \%$ of the vessels. Based on the relative cost of stoneware and earthenware crocks and jars, we can assume stoneware jugs cost more than earthenware jugs. ${ }^{86}$ However, William Ketchum (1991a, 30) notes that jugs can be fragile. Lifting a jug by its handle transfers the entire weight of the vessel and its contents to the handle, adding stress that may break the jug. While we do not know the capacity of the jugs from Quarter Site B, onegallon (3.78L) jugs made by the Bell family in Strasburg weighed 3.4kg (Comstock 1994a, 508$10)$. Or, as Toni Morrison $(2004,143)$ puts it, jugs were "always" heavy, "even when empty." If we add to this the weight of a gallon of molasses (approximately 5.4 kg ) or water (approximately 3.6 kg ), then a jug's handle had to support $7-8.8 \mathrm{~kg}$. As stonewares are more durable than earthenwares, their handles would be less likely to break, potentially making them a better investment. Additionally, as enslaved people carried jugs to and from the springhead, or to and from local market towns, they may have bumped or dropped them, potentially breaking the vessel and spilling its contents. The extra durability of stoneware jugs made them less likely to break when these accidents occurred, and this may have influenced enslaved consumers' decisions to select these vessels.

[^71]
## Dangerously Redefining Enslaved Humanities

The evidence suggests that enslaved people primarily used locally-made utilitarian ceramics to make and store food, which connects these vessels to our earlier discussion of hunger (see Chapter 6). Enslavers issued weekly rations of cornmeal and salted pork/fish that rarely provided enough food for enslaved women and men, especially during the summer months when they worked long hours under the hot Virginia sun. This lack of adequate rations became assembled with discourses about enslaved people's humanities that enslavers used to justify slavery, creating arguments that rations provided a wholesome and nutritious diet for enslaved people because they had different biological needs than white Americans. To redress the pain and suffering caused by insufficient rations, women and men enslaved at Belle Grove tended gardens, raised poultry, hunted, fished, and gathered nuts, fruit, and greens. Through these actions the women and men enslaved at Belle Grove engaged in an ontological counter politics, redefining their humanities on their terms by proclaiming that they could not survive on the food the Hites issued to them. However, what we did not discuss earlier is the temporality of these politics (also see Perry 2017). Certain types of food are only available at certain times of the year. In Virginia's relatively temperate climate, peaches, plums, cherries, blackberries, tubers, cucumbers, corn, and walnuts have limited growing seasons, providing food for a few months at best. This tethered enslaved people's ability to redress the gastronomic violence imposed on them and to redefine their dietary needs to seasonally available foods. In other words, they could not sate their hunger or redefine their humanities using freshly gathered wild plums in the winter or early spring, as these fruits were not available. That is unless enslaved women and men could preserve plums, making them available (at least in some form) throughout the year. Because of

Figure 38. Sugar purchased by enslaved consumers, by month. Data is available in Appendix E, Table 1.
this, storing food may have been an important part of the ontological politics of hunger in the Shenandoah Valley.

One way of doing this, at least metaphorically, was to exchange fresh produce in the summer and fall for cash or credit that could be "stored" until it was exchanged for food in the winter or early spring. Merchants' ledgers show that January was the second most common month for enslaved customers to buy sugar (Figure 38), with these purchases providing a cheap source of calories to supplement meager rations when other foods were not available. A woman enslaved by Samuel Bell also bought a pound of cheese in Winchester on 7 January 1846 (Milton $1849,35)$, possibly for the same reason. Other foods could be directly preserved in various ways. Corn could be easily dried and stored for months, especially when kept in "wooden box[es]," "gourds," or other containers that kept rodents out (Northup 1853, 169). Potatoes and cabbage keep well when stored in cool, dark places, while sweet potatoes are best stored in warm, dark locations. Depending on its location relative to the cabin's chimney base (which we did not find in our excavations) the root cellar (Feature 3) and subfloor pit (Feature 24) under Cabin 1 could
have met either of these conditions, allowing the women and men living in the house to store food well into the winter (Samford 2007). ${ }^{87}$

Other foods, like cucumbers or blackberries, store better when pickled, or as jams, jellies, or preserves. Here, crocks and jars are especially important as they are designed to store these foods. The women and men living at Quarter Site B may have also raised pigs or cattle since we know that other enslaved Shenandoahans did so. Slaughtering these animals or hunting larger mammals like deer created an abundance of meat that enslaved people needed to preserve if they wanted to eat it in the future. Since they most likely did not have access to smokehouses to cure this meat, pickling it in crocks/jars may have been their best option. The relative amount of crocks and jars attest to the importance of storing food in them, as one out of every seven or eight vessels (13.53\%) from Quarter Site B whose form I could identify was a crock or jar. This indicates that these vessels may have been important components of the ontological politics enslaved Shenandoahans enacted to redefine their humanities. However, we cannot suggest that storing food in crocks and jars was only about these politics. Pickled meats and jams taste different and have different textures than their fresh counterparts, and enslaved people may have also stored food in this way because they liked the way they tasted.

The repurposed pans used for cooking also contributed to these politics. If we are correct that enslaved people used these to prepare something other than cornmeal, then the food cooked in the pans would have been procured by enslaved people. In other words, the pans helped transform the raw food enslaved people worked so hard to get into cooked food that helped them stave off hunger. Furthermore, since foods prepared in ceramic vessels take longer to cook,

[^72]enslaved cooks probably did not use these pans every day, likely using cast iron pots most of the time and pulling out pans on Sundays or other days they might have more time to devote to cooking. If so, these pans and the cooks who used them might have broken up the harsh temporality of enslaved life, punctuating weekly routines with distinct tastes and smells. Cooking and eating these foods could be social events that brought people together, letting (grand)parents hand laden plates to (grand)children, lovers pile food into saucers for their hungry partners, or friends and neighbors serve meals to each other. The bonds created and maintained in these social spaces redressed the fungibility of Black flesh, and allowed enslaved women and men to reject enslavers' notions that all enslaved women and men should be given the same amount of food by deciding on their own how much food different people should get.

Using lead-glazed vessels to enact these politics, however, could be dangerous. Lead glazes in the Valley are composed of, on average, $43.77 \%$ lead oxide (Greer and MacDonald 2022), but because they are fired to relatively high temperatures (over $950^{\circ} \mathrm{C}$ ), the lead is generally unable to leach food stored in them (Comstock 1994a; Szalóki et al. 2000; Somogyi et al. 1999). Unfortunately, lead glazes can easily contaminate food if acidic substances are stored in vessels for long periods or if the vessels are heated up, and enslaved women and men at Quarter Site B used lead-glazed earthenwares in ways that met both conditions. Meat, saltpeter, and salt have neutral pH levels, so crocks/jars of pickled meat were probably safe from lead contamination. But fruits and vegetables are generally acidic (Table 27) and preserving them in lead-glazed crocks and jars along with acidic substances like sugar or vinegar would have caused lead to leach into the food. The longer it was stored, the more contaminated the foods would have become. Cooking in lead-glazed pans also applied enough heat to these vessels for lead to seep into food (e.g., Gersberg et al. 1997). We do not know how this lead affected the women,
children, and men at Quarter Site B, but it is inconceivable that it would not have affected how they saw and moved through the world around them.

Interacting with utilitarian wares could affect enslaved life in the Valley in a variety of ways. These vessels allowed enslaved women and men to store water, molasses, and/or certain types of food, just as they (unfortunately) contaminated these substances and the hungry people who ate them with lead. Utilitarian vessels also allowed enslaved people to engage in certain forms of ontological politics and to redress the pain and hunger from inadequate diets well into the winter and early spring when other food sources were not readily available. These stories are just as much a part of the history of Shenandoah Valley ceramics as the role they played in (re)producing German/white identities. However, these were not the only locally-made clay objects that affected the lives of enslaved women and men at Belle Grove. In the following chapter, we consider the role brick chimneys played in the ontological politics of enslaved life.

## Chapter 10: Brick Chimneys

[S]uddenly there was Sweet Home, rolling, rolling, rolling out before her eyes, and although there was not a leaf on that farm that did not make her want to scream, it rolled itself out before her in shameless beauty. It never looked as terrible as it was and it made her wonder if hell was a pretty place too. Fire and brimstone alright, but hidden in lacy groves. Boys hanging from the most beautiful sycamore trees.
(Morrison 2004, 7)
Sparks floated upward into the chimney. This had happened countless times before, but tonight one landed on a patch of oily creosote. Instead of going out, the spark began glowing brighter and brighter until the creosote caught fire, turning the chimney into an inferno, and causing flames and smoke to spew into the cabin it was attached to. I do not know the names of the enslaved women, children, and men who may have been in House Site 1 when this happened, or even how many people lived in the cabin. But we can sympathize with the terror that would have gripped them as they scrambled to get everyone out of the burning house, and the sense of loss that would have followed immediately afterward as their belongings went up in flames (see A. F. Moore 1865).

This chapter is about House Site 1 at Belle Grove Plantation, the fire that demolished it in the 1850 s, and the brick chimney the fire started in. But understanding this tragic event requires exploring the landscape around the $\log$ cabin, the political work architecture did within the enslaving assemblages that made Belle Grove possible, and the ways enslaved people reassembled the chimney with their own definitions of order and humanity so they could build lives for themselves (also see Angelo 2017). Ultimately, this chapter is about the power struggles that occurred in plantation landscapes. Other archaeologists have studied the political aspects of plantation landscapes throughout the Americas (e.g., Armstrong 1999; Bassett 2020; Bates 2015; Chidester 2009; Cochran 2021; Delle 1998; 2014; Edwards 1998; Epperson 2000; McKee 1992;

Randle 2011; Singleton 2001; 2015a; 2015b; Symanski 2012; Upton 1984). But I differ from them by emphasizing two aspects of landscapes that rarely get discussed. The first is a focus on the ontological politics of plantation landscapes and how these not only reproduced racist political economies that advanced slavery but how they specifically reproduced white supremacist definitions of humanity that underwrote slavery (sensu Wynter 2003) and how, in turn, they became places where enslaved people engaged in ontological counter-politics by actively redefining their humanities. The second is the materiality of plantation landscapes, specifically how the physical qualities of bricks at times advanced and at other times frustrated enslaver's definitions of humanity and the ideas of order they depended on. Focusing on these brings about archaeological perspectives on plantation landscapes that let us theorize the lives of enslaved people in new ways.

## Cartographic Projections of Order and Humanity

As discussed throughout Assembling Enslaved Lives, an intense ontological politics waged over the definition of humanity and who could count as fully human played out in sites of slavery throughout the Americas (Wynter 2003). In short, $19^{\text {th }}$-century enslavers defined themselves as fully human by proclaiming themselves to be rational and orderly, attributes they considered to be the hallmark of humanity. At the same time, they defined Black women and men as ontologically different, as people who were inferiorly human because they could not attain the racialized ideals of order that enslavers considered to be their birthright (e.g., Z. I. Jackson 2020; Judy 2020; T. L. King 2019; Weheliye 2014; Wynter 2003; 2006; 2015). These white supremacist discourses provided the ontological basis for slavery, placing Black people in a racialized form of humanity enslavers considered to be enslaveable. However, "definitions belong to the definers - not the defined" (Morrison 2004, 225; also see Baldwin 1993, 4), and the
available evidence strongly suggests that enslaved people in the Shenandoah Valley did not accept the ways white Shenandoahans defined their humanities. Rather, the data presented in the previous chapters indicate that enslaved Shenandoahans engaged in an ontological counterpolitics by creating definitions of what it meant to be human that lay outside white supremacist ideologies.

Previous chapters discussed the role agricultural labor, food, consumption practices, and ceramics played in these ontological politics. But Tiffany King (2019) demonstrates that they also played out through landscapes. Using an $18^{\text {th }}$-century map of South Carolina, she discusses how colonial cartographic designs emerged from enslavers' growing anxieties about Blackness and their desire to spatially order the world in ways that proclaimed themselves to be fully human. In other words, they used maps to define themselves as the cartographic embodiment "of spatial coherence and logocentric order" and as the orderly possessor of "the objects and bodies that appear[ed] on... map[s]" (T. L. King 2019, 88). This was done through cartographers’ aesthetic choices, such as having a neat, orderly list of enslavers' names and their estates on maps and having these be the only human presence in the territory claimed by white enslavers (also see Tinsley 2010, 72-80; K. A. Thompson 2006). ${ }^{88}$

Similar discourses are present in two early- $19^{\text {th }}$ century maps of the Shenandoah Valley. The first is Charles Varle's and Benjamin Jones's "Map of Frederick, Berkeley, \& Jefferson Counties in the State of Virginia" (1809) (Figure 39). As the name suggests, this is a map of these three counties in the northern Valley. It is an exceptionally accurate map listing the location of dozens of homes, mills, and roads (E. G. Moses 2018). Yet, the map is defined as

[^73]

Figure 39. Map of Frederick, Berkeley, \& Jefferson Counties in the State of Virginia by Varle and Jones, 1809. Image courtesy of the Library of Congress.
much by what it lacks as what it portrays. Focusing on the area between Cedar Creek and

Figure 40. Inset from Varle and Jones's map, showing the area around Belle Grove Plantation ("I. Hite"). The location of the Vaucluse plantation, discussed below, is labeled "W.S. Jones." Image courtesy of the Library of Congress.

Newtown (Figure 40), the map depicts major roads, mills, and other agro-industrial complexes.
But the only other buildings are the homes of three wealthy enslavers, Isaac Hite (Belle Grove), Abraham Nieswander (Nieswander's Fort), and W.S. Jones (Vaucluse). There are no barns, outbuildings, poor or middling white households, or enslaved quartering sites. This stems from the fact that it cost money to have your house included in the document, making it a map of rich
white families and where to find some of the things they profited from. But, focusing on the poetics of this map (sensu Glissant 1997), the way it composes the landscape and the effects that emerge from these compositions (see Chapter 2), what comes into focus is a cartographic projection of white enslavers as the sole inhabitants and sole proprietors of the region. It portrays these enslavers in an incredibly orderly manner, with their homes and names neatly printed, projecting a "spatial coherence and logocentric order" onto these elite families that worked to define them as fully human (as they would have understood it) (T. L. King 2019, 88). Because no one else is depicted on the map, the document only applies this definition of humanity to enslavers.

The second map is a plat of W.S. Jones's Vaucluse plantation (Vaucluse Plat 1815) between Middletown and Newtown (Figure 41). Unlike the Varle and Jones map, the Vaucluse plat only depicts this plantation, focusing on the 1,122-acre estate's boundaries, the location of buildings within the plantation core, and demarcating plots/fields within the estate. These plots, which are the dominant features on the map, are irregularly shaped, as Valley fields tend to be, likely respecting landforms instead of creating well-ordered, regularly sized fields that imposed the rationality enslavers craved onto the landscape. But this is not to say that the map is unorganized. Each plot has its acreage inscribed in it, and the total acreages are calculated in the upper left corner of the document. Most plots are also color-coordinated, shown in blue, brown, green, red, and yellow. Blue plots are listed as woodlots, suggesting that other colors indicate fields lying fallow, used for pasture, and/or planted with different grains (see Chapter 5). As with Varle's and Jones's map, this document was made for a specific purpose, one that did not necessarily require showing the terrain or where the 27 women and men enslaved by Jones lived (US Bureau of the Census 1810a). But as with the other map, depicting Jones and his family as

Figure 41. Plat of Vaucluse farm, April 26, 1815. Image from the Ann C. Randolph Jones Family Papers Collection (451 THL) at the Stewart Bell, Jr. Archives Room, Handley Regional Library, Winchester, Virginia. Image courtesy of the Bell Archives.
the sole occupants of this well-ordered, color-coded landscape did political work, defining the Joneses in ways they considered to be orderly, rational, and fully human.

## Orderly Landscapes and Racializing Bricks

Black bodies... were fundamental to the construction of the plantation as a white space where the white settler-master could dwell and self-actualize as the archetypical human. The slave's racialized body is used to construct this space as the space of civil society, as the space of the living.
(Haymes 2018, 43)
While they emerged from broader discussions about what it meant to be human, $19^{\text {th }}$ century maps did not circulate widely. Valley elites may have hung copies of the Varle and Jones map in their parlors, but most people did not have access to their homes, nor could they afford to buy a copy of the map themselves. Plats like the one of Vaucluse were more common, but they were generally stored with other legal documents in dwellings and courthouses and consulted only when needed. But enslavers also engaged in these racist discourses in more quotidian ways by materially enacting them on plantation landscapes through architecture (M. H. Johnson 2002; 2013; 2015; Khatchadourian 2016; Leone 1984; A. T. Smith 2003; 2015; for more on plantation architecture Bates 2015; Delle 1998; 2014; Leone et al. 2005; Rothenberg 2021; Singleton 2001; 2015a; 2015b). The best way to see this at Belle Grove is to look at how the Hites and other white Shenandoahans experienced the landscape when moving through it.

For white Shenandoahans, getting to Belle Grove required traveling along the Great Wagon Road (modern Rt. 11), which was the plantation's southern boundary, and turning north onto what is today Belle Grove Road (VA 727), which cut through the property (Figure 42). The first structure a passerby would come to is a one-and-a-half-story limestone building used as the plantation's office and as a general store. Just beyond the office and store, the road curves

Figure 42. Plantation tour of Belle Grove. Background map is "Sketch of the Battle of Belle Grove or Cedar Creek" by Jedidiah Hotchkiss, 1864. Image courtesy of Library of Congress.
slightly eastward and two areas fully come into view. Looking from left to right, the first
buildings are part of an agricultural complex with several sheds, a large stable, and a sizeable barn (Figure 43). Between this complex and the road are several log cabins with brick chimneys associated with Belle Grove's main quartering site, Quarter Site B. If it's a Sunday there would be enslaved women, children, and men doing chores and socializing around the cabins. On any other day, there might just be a dozen or so children and a few elderly people keeping an eye on them. Across Belle Grove Road is the plantation's manor house, an imposing 100' long one-and-a-half-story limestone dwelling with imported Aquia sandstone coining and window trim (Figure 44). Scattered around the manor house are a series of outbuildings including a smokehouse and an icehouse made of a combination of wood and limestone, and Old Hall, a wooden two-and-a-

Figure 43. Manor house grounds, 1860s. The manor house is in the center of the image, with Old Hall to the left, and an outbuilding in between the two. The lighter-colored stones at the corners of the manor house and above the windows are the sandstone coining and trim (respectively). Image courtesy of Belle Grove, Inc.
half-story house with two limestone chimneys. Behind the manor house was a large garden, and to the right of the house stood the plantation's orchard. Moving onward, a few hundred feet beyond the quarter site is a $\log$ cabin with a limestone foundation and chimney where white families employed by the Hites lived. And just beyond this, Belle Grove Road intersects with Middle Road (VA 624). Going left leads to several agro-industrial buildings, including a storehouse, a grist mill, a sawmill, and a distillery, all made of limestone and wood. Going right leads to the neighboring property (Cedar Grove). And straight ahead, Belle Grove Road continues to pass through the plantation, eventually leading to the Hites' Rockville estate.

The landscape the hypothetical traveler experienced was highly organized. As Erica Moses and I discuss elsewhere (2018), Belle Grove was laid out on two perpendicular axes that intersect at Old Hall (Figure 45). The first, running roughly north northeast to south southwest, connects the office and store, Old Hall, several outbuildings behind Old Hall, and the plantation's enslaved burial ground. The second, running roughly east southeast to west northwest, connects the orchard, the manor house, an extant limestone outbuilding, Old Hall, and

Figure 44. Barn (right) and stable (left) at the agricultural complex (44FK521). Taken from Photo 11.9, by Thomas D. Biscoe, 30 July 1884. Image courtesy of Marietta College.
what my team and I think might be the location of the large barn in the agricultural complex across the road. Quarter Site B is noticeably off-grid, with the site's houses located north of the second axis. This was likely intentional, positioning the quarter in such a way that the Hites and their guests standing on the front lawn could not see the cabins or be seen by the women, children, and men living in them. In fact, no other houses would have been visible from the front lawn, or when gazing out the front windows. This manipulation of lines of sight allowed the Hites and their guests to live out the fantastic emptiness maps projected onto $18^{\text {th }}$ - and $19^{\text {th }}$ century maps and to play out the experience of being the sole inhabitants of the landscape.

This layout was not implemented all at once. It incorporated structures paid for and built by enslaved women and men's forced labor before 1780 (Old Hall), during the 1780s (the office and store), the 1790s (the manor house), and c. 1800 (Quarter Site B), not to mention the enslaved burial ground, the barn, the stable, and other outbuildings around the manor house I do not have firm dates for. This highly orchestrated landscape and the decades-long planning that went into it would have reproduced the Hites' understandings of rationality and order, defining them as fully human within the racist definitions of humanity they ascribed to while simultaneously making excuses for the brutal violence they inflicted on Black women, children,

Figure 45. Two axes of the plantation landscape at Belle Grove. The location of the barn and several other buildings on the landscape are not depicted as we have not confirmed their exact placement archaeologically. Similarly, the orchard is not shown as we do not know its extent in the early-19th century. Map by Erica G. Moses.
and men to extract profits from their labor and their bodies. As Toni Morrison states in this chapter's epitaph, plantation landscapes can be beautiful, but they were also places of extreme violence. As a result, it is possible to admire the layout of Belle Grove and the orderly way the Hites arranged buildings and lines of sight, to appreciate the cartographic talent that went into the Varle and Jones map, or be fascinated by the color-coordinated fields of the Vaucluse plat. But to do so responsibly requires recognizing the ontological violence and terror this landscape and these maps created, and the ways this justified accumulating profits from Black flesh (sensu Spillers 1987).

Manipulating plantation landscapes in this way was common in the late- $18^{\text {th }}$ - and early$19^{\text {th }}$ centuries, especially at Virginia plantations like James Madison's Montpelier (Pasch 2019; Reeves 2016; Reeves and Greer 2012) and Thomas Jefferson's Monticello and Poplar Forest (Epperson 2000; Gary and Proebsting 2016; Hallock 2017; Neiman 2008; Trussell 2012). The Hites frequently corresponded with Madison and incorporated Jeffersonian architectural details into the manor house, so they were probably aware of how the landscapes at Montpelier and Monticello were organized and how Belle Grove fit into these larger spatial practices. More broadly, Belle Grove was part of a hemispherical conversation about how to materially enact enslaver's definitions of humanity that took place in European outposts dotting the African coastline, in slave ships, on plantations in the Valley, Brazil, and Cuba, and in the halls of power in Europe. Without materializing these discourses and the definitions of humanity they produced, slavery could not have operated. Yet, there is no way of knowing if visitors and passersby were fully aware of the political work Belle Grove's landscape was doing (see M. H. Johnson 2002, 15; Pollard and Gillings 1998, 144). But another aspect of the plantation landscape would have been readily apparent.

Thinking back to the plantation tour, the office and store was built of limestone, as was the manor house, the icehouse, and an extant outbuilding on the manor house grounds.

Archaeological research shows that Old Hall, three other buildings on the grounds, and a freestanding bake oven had limestone foundations (Geier 1995; Greer 2022; Rockwell 1974). Old Hall may have also had a one-story limestone addition on its north façade. The white employee house has a limestone chimney base, a continuous limestone foundation on its south façade, and limestone piers on its north façade (Geier and Zienty 2001; Greer 2021). All the identified buildings in the agro-industrial complex have limestone structural elements. In short, limestone
is one of the primary building materials at Belle Grove. And this makes sense, given that limestone is everywhere at the plantation. The bedrock in this part of the Valley is composed of limestone, and the plantation core is severely eroded, with exposed limestone outcroppings seen throughout the property. Furthermore, the northern portion of the plantation is located on a vein of high-quality New Market limestone and a historic quarry has been identified at Belle Grove (Geier and Whitehorne 1994). This is where enslaved women and men may have gotten stone used in many of the buildings at the plantation. And yet, one building stands out among the rest. Of all the extant and excavated structures at Belle Grove, only House Site 1 at Quarter Site B has brick structural elements. Excavations at the cabin recovered 119.43 kg of brick fragments and 2.21 kg of mortar. My team and I did not find any evidence of a foundation, so this relatively large amount of brick probably came from a chimney. Additionally, $83.75 \%$ of the cabin's bricks came from a $15^{\prime} \times 9^{\prime}$ area, strongly suggesting the presence of a chimney fall (Figure 46). ${ }^{89}$ While it is possible that the brick is from a hearth/chimney base, we recovered substantially more brick than has been recovered at excavations of cabins with brick hearth/chimney bases (e.g., A. Marshall 2011; Trickett 2013b), making this unlikely.

The houses enslaved Virginians lived in often had stick and mud chimneys (Figure 47) (e.g., Hallock 2017; Kelso 1984, 106; Reeves and Greer 2012; Ryder 1991). Perhaps the most detailed account of these comes from John Pendleton Kennedy's Swallow Barn (1853, 449-50), a novel set in Tidewater Virginia but based on the landscapes and discourses Kennedy interacted with while visiting his family's Shenandoah Valley plantation. He writes (1853, 450):

The chimneys communicated even a droll expression to these habitations. They were, oddly enough, built of billets of wood, having a broad foundation of stone, and growing narrower as they rose, receding gradually from the house which it was attached, until it reached the height of the roof. These combustible materials

[^74]

Figure 46. Evidence for the brick chimney. Block of units in the center of the map is the area excavated to find the extent of House Site 1. Dataset presented in Appendix H, Table 1. Map by author.
were saved from the access of fire by a thick coating of mud; and the whole structure, from its tapering form, might be said to bear some resemblance to the spout of a tea kettle....

Because these chimneys are so common in Virginia, I would have expected House Site 1 to have one. But instead, it had a masonry chimney. It is possible that enslaved women and men living at House Site 1 wanted a masonry chimney and chose to build one for themselves. However, if they had I would expect it to be made of limestone. In addition to the quarry mentioned above, limestone cobbles and boulders are found throughout Quarter Site B and the surrounding fields, making this material widely available. Instead, the cabin has a brick chimney. Because bricks were not widely used at Belle Grove, there would not have been stockpiles left over from other construction projects that enslaved people could use, so the bricks were bought specifically for

Figure 47. Photograph of a cabin with stick and mud chimney, Bon Air, Virginia, 1888. Note the wooden chimney off the left side of the cabin and the two poles supporting the chimney. Also, note the lack of grass around the cabin, likely indicating the presence of a swept yard. Image from Stottman and Stahlgreen (2017, 9).
the chimney. Bricks from the site are indistinguishable from those made in workshops in the northern Valley in their size, color, and inclusions, suggesting that they were made by brickmakers in local towns instead of onsite by enslaved people. ${ }^{90}$ We also found bricks scattered throughout Quarter Site B, indicating that other cabins had brick structural elements and suggesting that House Site 1's chimney was part of a larger discussion about how cabins should be constructed. As a result, I argue that the widespread use of this expensive building material (relative to limestone) suggests that the Hites selected and paid for the bricks, even if it was enslaved people who did the hard work of constructing these chimneys.

[^75]There is other evidence that suggests that the Hites dictated how Quarter Site B looked and what went inside of the cabins, most notably the fact that House Site 1 had a cast-iron stove attached to its brick chimney. ${ }^{91}$ Stoves were expensive, costing between $£ 2.7$ and $£ 12.35$ each in 1796 (\$281 and \$1,476 in 2020, respectively) (Account Book 2 1797, 256, 270), and enslaved Southerners despised stoves as they did not provide as much light for their homes as open hearths ( N 1856), making it unlikely that enslaved people bought the stove for themselves. As a result, it is likely that the Hites bought the stove and insisted that it be installed in the cabin. In other words, the Hites mandating brick chimneys for the cabins would be in keeping with other choices they made about Quarter Site B.

There are a variety of reasons the Hites could have made this choice. White Southerners often commented on the condition of enslaved people's houses (American Farmer 1826; Edwards 1998, 254; Farmers' Register 1837b; Milo 1849; Spirit of Jefferson 1853c), including their chimneys (American Farmer 1833; Macomb 1827; N 1856; J. Taylor 1814, 122). As it abutted Belle Grove Road, Quarter Site B was highly visible to white Shenandoahans traveling through Belle Grove, so the Hites may have insisted on masonry chimneys as a public statement of their wealth to passersby. Masonry chimneys were also more appealing to white aesthetic tastes, rising upwards at right angles instead of leaning away from houses. The Hites may have used masonry chimneys to create a more orderly, visually appealing landscape from their perspective. Despite their "thick coating of mud," many stick and mud chimneys eventually caught fire (Kennedy 1853, 450; J. Taylor 1814, 123), and masonry chimneys may have been the Hites way of preventing the chaos of a chimney fire from igniting on their orderly landscape.

[^76]Any (or all) of these could have influenced the Hites' decision. But these goals could have been accomplished with freely available limestone instead of brick, which, again, would have been bought specifically for Quarter Site B.

Addressing why bricks may have been selected requires reckoning with the aesthetics of this material and how it could become assembled with racializing discourses that allowed slavery to operate. At Belle Grove, there is a correlation between building material and race. People categorized as white lived in houses with stone while people categorized as Black lived in houses with brick (also see Hallock 2017, 29). Therefore, the bricks reiterated ideas about race by differentiating dwellings for white and Black people and by extension differentiating the people who lived in them (also see Heneghan 2003). This turned the brick chimneys into components of racializing discourses that proclaimed people of African and European descent to be ontologically different. Assembling architecture with racializing discourses was not unique to Belle Grove. For instance, in Swallow Barn, Kennedy (1853, 39-40, 449-50) describes enslaved people's homes as "rude," childlike, made with "little regard to neatness," "primitive" and poorly maintained. Kennedy projects these same qualities onto his enslaved characters. Yet, an important difference between the fictional Swallow Barn plantation and Belle Grove is that the quarter Kennedy describes is tucked away, hidden from white characters who do not seek it out, while Quarter Site B is highly visible. As a result, a different discursive focus - orderly bricks instead of dilapidated cabins - was used to racialize enslaved people at Belle Grove.

The Hites and their employees would not have been the only white people to see this racializing architecture. In the $19^{\text {th }}$ century, the Great Wagon Road was the Valley's main thoroughfare (Hofstra and Raitz 2010). A few miles north of Belle Grove was Back Road, the second most important road in the northern Valley (Geier and Schruefer 2021). A series of
smaller roads connected these thoroughfares, one of which was Belle Grove Road, the road through Belle Grove discussed earlier. Additionally, Belle Grove Road provided access to the Hites' mills and other mill complexes along Cedar Creek. All this is to say that people who did not live at Belle Grove regularly traveled through the property using Belle Grove Road. White Shenandoahans coming up from the south to use the Hites' mills would have taken the same path as our plantation tour. During these trips they would have seen the plantation landscape, including the brick chimneys at Quarter Site B and the stone buildings surrounding it, orienting (sensu Ahmed 2007) their perception of Belle Grove and the people who lived there in ways that reproduced racializing discourses about ontological differences between free white and enslaved Black people (also see Browne 2015; Delle and Fellows 2015).

In this way the chimney's aesthetics did political work within local enslaving assemblages, pulling white Shenandoahans living outside of Belle Grove and who may not have enslaved people themselves into the racist logics through which slavery functioned in the Shenandoah Valley. The brick chimneys were not alone in perpetuating these discourses. Other materialities like cornmeal and salted pork (Chapter 6) and newspaper advertisements banning white people from trading with enslaved people (Chapter 7) reiterated racist discourses and pulled non-enslaving white Shenandoahans into enslaving assemblages. But the chimneys at least played a role in these assemblages. And because all parts of an assemblage influence (to some degree) how its parts come together and interact (see Chapter 2), it is important to see the chimney as influencing how ideas about race circulated locally, even if other things may have played a larger role.

Ultimately, these poetics are more important than determining who chose the bricks or why they did so. Regardless of who or why, the chimney's aesthetics connected passersby with
racist arguments about the supposed ontological differences between people of European and African descent. This points to one of the ways that slavery adapted to the unique conditions of the Shenandoah Valley. These discourses about stone and brick do not translate into other parts of Virginia, where enslavers commonly lived in brick homes, brick chimneys are not uncommon at quartering sites, and stone architecture is rare.

## Alternative Formations of (Dis)Order and Humanity

The conditions of bondage did not foreclose black geographies but rather incited alternative mapping practices during and after transatlantic slavery, many of which werelare produced outside the official tenets of cartography: fugitive and maroon maps, literacy maps, foodnourishment maps, family maps, music maps were assembled alongside 'real' maps...
(McKittrick 2011, 949)
While local maps concealed the presence of enslaved life in the Valley and the Hites tried to present enslaved people and their homes in ways that reproduced racist/racializing discourses, Black women, children, and men were finding ways to make lives for themselves at Belle Grove (also see Battle-Baptiste 2004; 2010; Camp 2004; Fesler 2010; Greer 2016b; Heath 2010; T. L. King 2019; McKittrick 2006; Singleton 2015b; Souza 2016; Symanski 2012). Because they were excluded from the racist understandings of order and rationality the Hites claimed for themselves, the ways enslaved people took up residence (sensu Silliman 2001; 2014) on the landscape were not bound by the same rules that governed white sensibilities. Instead, enslaved people, and especially enslaved women, recomposed the landscape around House Site 1 in ways that centered on the brick chimney but produced alternative formations of order and humanity (Z. I. Jackson 2020; T. L. King 2019; McKittrick 2006; Wynter 2003; 2006; Wynter and McKittrick 2015; Weheliye 2014). One way to approach this is through religion.

Most Valley enslavers were (at least nominally) Christian. Like many religions, Christianity revolves around one's relationship to God, thereby defining the ontological category
of the human by demarcating it from the supernatural (see Wynter 2003). ${ }^{92}$ As a result, Christian cosmologies played a role in creating enslaver's definitions of humanity. Frequently, enslavers assembled this religious understanding of humanity with racist discourses to perpetuate slavery (Longenecker 2002, 113-52). Some excluded enslaved people from attending religious services, thereby segregating access to Christian-based ways of being human. Catherine Sims $(1972,79)$, for instance, stated that her Rockingham County enslavers "took me to church wid dem and dey put me behind de door. Dey tole me to set der till dey cum out. And when I see dem cumin' out to follow behind and get into de carriage." Bethany Veney $(1889,16)$ recalled that after she began attending a local church, her Page County enslaver sent her "to old Mr. Levers, two miles away, there to stay until I should get over my 'religious fever,' as he called it." Others, like Jenny Buchanan's Rockingham enslaver, barred enslaved people from attending church but forced them to attend late-night prayer sessions (Still 1872a, 523). We do not know what was said in these meetings, but Veney $(1889,7-8)$ gives us some insight, recalling that enslavers used religious imagery to threaten enslaved children caught stealing apples, and John Adams (1872, 20) stated that ministers in Frederick County told enslaved people that "they must obey their master and mistress, and all would be right." Other enslavers encouraged enslaved people to convert to Christianity and join local churches. Harry Robinson recalled that his Jefferson County enslaver (1972, 239), for instance, "built us a church, and we could have prayer meeting[s] when we wanted to. We had a colored preacher and deacons too.... The whites would come in for revival sometimes." However, Stephen Longenecker (2002, 130-35) notes that even

[^77]when Black Shenandoahans were welcomed into local congregations, much of the practices and discourses that occurred in churches worked to perpetuate slavery.

Despite the anti-Blackness woven into Valley churches, many enslaved Shenandoahans grasped onto Christianity, recoding its message to enact a counter-politics that addressed their own needs (also see Greene-Hayes 2021, 42-43). Veney, for instance, insisted on a Christian ceremony when she married her first husband, although they chose not to vow "that we would always be true to each other, forsaking all others, as the white people do in their marriage service, because... at any time our masters could compel us to break such a promise." Other enslaved people, however, countered enslaver's Christian cosmologies by practicing African religions and enacting the definitions of order and humanity that emerge from these cosmologies.

In contrast to Christian cosmologies and liberal humanist ontologies, the worlds inhabited by adherents to African cosmologies are filled with spirits, some benevolent, some malicious, and some benign (e.g., Douglass 1855, 53; Edwards 1998; Hurston 2008; Murray 2007; Sweet 2011; R. F. Thompson 1984; J. R. Young 2007). For instance, an unnamed man who had been enslaved a few miles from Belle Grove recalled numerous ghosts and spirits residing on the local landscape, some related to the Civil War but others seemingly older and who may have haunted the region in the early- to mid-19 ${ }^{\text {th }}$ century (C. Johnson 1915a). For enslaved people, taking up residence in these landscapes required managing relationships with spirits (e.g., Battle-Baptiste 2010; Bilby and Handler 2004; V. Brown 2008; Greene-Hayes 2021, 46; Ogundiran and Saunders 2014b). These more-than-human interactions defined what it meant to be human in the Black Atlantic, demarcating humans and spirits (also see Murray 2007), and it was things that mediated these relationships and enacted these definitions of humanity (also see M. E. Buchanan
and Skousen 2015; Pauketat 2013). ${ }^{93}$ Archaeologists often find such items, which James
Davidson and Karen McIlvoy (2012) refer to as "charms," while excavating enslaved and Free Black households (e.g., Davidson 2015; Ferguson 1992; L. A. Lee 2014; Ogundiran and Saunders 2014a; Ruppel et al. 2003; Russell 1997; Samford 2007; Singleton 2015b; Wilkie and Farnsworth 2005; A. L. Young 1996). One of the more commonly discussed charms are quartz crystals, which either facilitated relationships with benevolent spirits (usually one's ancestors) or protected people from malevolent spirits who were repelled by light "flashing" off crystals (Davidson and McIlvoy 2012, 135-44; Leone and Fry 1999, 372, 384).

We recovered 51 quartz crystals from Quarter Site B. But quartz naturally forms in limestone fissures, and a variety of geological processes can cause crystals to be present in topsoil and subsoil, so many of the crystals from Quarter Site B (especially the smaller ones) may not have been used as charms. But the distribution of larger crystals ( $4-6 \mathrm{~cm}$ long) strongly suggests the intentional placement of charms. Three of these are from units associated with House Site 1, with one from the chimney fall (QB076), one from a layer of charred debris that got deposited into the subfloor pit (Feature 24) during the house fire, and one from the northernmost corner of the house debris (QB106). ${ }^{94}$ These account for half of the larger crystals from the site, even though only $25.86 \%$ of the units are associated with the cabin, suggesting that the distribution of larger crystals is not random. Furthermore, the crystals from the chimney fall

[^78]and subfloor pit are from deposits containing little topsoil or subsoil, suggesting we found crystals there because they had been in the house when it burned, likely to mediate enslaved people's relationships with the spiritual forces around them.

The crystal from the chimney fall has the best contextual evidence for how it may have been used. Davidson and McIlvoy (2012, 139-40) note that chimneys and hearths were vulnerable places where malevolent spirits could gain entry not only into the home but into enslaved people's food, making them important places to protect. Charms have been recovered from the chimneys/hearths of Black homes in Georgia, Louisiana, Maryland, South Carolina, Texas, and Virginia (e.g., Kenneth L. Brown and Cooper 1990; Davidson and Mcllvoy 2012; Edwards 1998, 262; Galke 2000; Leone and Fry 1999; S. K. Moses 2018; Wilkie 1997), suggesting that many Black Southerners sought to protect themselves and their household by putting things in/around their chimneys. A quartz crystal from the chimney fall associated with an enslaved house from Virginia's Montpelier plantation (Greer 2014, 159) is particularly relevant here. Twenty-four of the 101 people the Hites enslaved in 1810 came from Montpelier (see Chapter 4), suggesting that this way of interacting with spirits may have been well-known at Belle Grove. Given this, someone living in House Site 1 likely placed the crystal in the chimney to protect the home. This action, however, did more than protect these women, children, and men. It reiterated and repeated African cosmologies through the ways it assembled and territorialized humans and the decomposing effects malevolent spirits could have on them. This cosmology, moreover, was predicated on a particular definition of the human and a specific way of ordering the world that was not attached to Christian cosmologies. As a result, the way of being in the world created by the crystal, the chimney, the people who put it there, and the spirit(s) it provided protection from enacted a counter-politics that redefined enslaved people's
humanities in their own terms and created an alternative understanding of how landscapes should be ordered and shared. Tucked away inside the chimney, the Hites were probably unaware of the crystal and the counter-politics it engaged in. But other ways of rearranging Quarter Site B were noticeable.

Swept yards are a common landscape feature in quarterings sites throughout the Americas (e.g., Armstrong 1999; Armstrong and Kelly 2000; Battle-Baptiste 2004; 2007; 2010; 2011; Botwick 2018; Fesler 2010; K. K. Harris 2020; Heath 2010; Heath and Bennett 2000; Parry 2018). As the name implies, these were yard spaces enslaved people, especially enslaved women, regularly swept clean with homemade brooms, a practice that within the African diaspora is often traced back to West Africa (Battle-Baptiste 2007; 2010; 2011). Barbara Heath and Amber Bennett (2000) argue that domestic refuse from yards should be no larger than 2 cm , as enslaved women swept larger artifacts away, and Garrett Fesler (2010) argues that trash scatters often occur at the edges of yards, where sweepings piled up and larger items were tossed. Units surrounding House Site 1 have less domestic refuse, especially fewer large ( $>2 \mathrm{~cm}$ ) artifacts, than units further away (Figure 48), suggesting that enslaved women like Abba, Judah, Truelove, and Sally etched yard spaces onto the plantation landscape. We also identified large trash scatters at the southern (Midden 1), eastern (Midden 2), and northern (Midden 3) edges of the yard.

Yards provided areas for enslaved people to congregate outside the often-cramped confines of their homes, serving as a gathering place where bonds of kinship (biological or otherwise) could be reiterated (e.g., Battle-Baptiste 2004; Fesler 2010; K. K. Harris 2020; Heath and Bennett 2000; Mintz 1974; also see Armstrong and Fleischman 2003). They were also places

Figure 48. Interpolation maps showing the distribution of total domestic refuse and domestic refuse over 2 cm long. The block of units in the center of the map is the location of House Site 1. The smaller block to the north contains the three fire pits. Maps generated using inverse distance weighting (IDW) interpolation using four nearest points. Data presented in Appendix H, Table 2. Map by author.
where communities developed as people from different households spent time with one another.
For instance, we identified and excavated three fire pits in the northern portion of the yard. Two of them were probably used for outdoor cooking, while the third appears to be a smudge pit - a fire intended to produce smoke to keep insects away (e.g., Binford 1967). Cooking over a fire is a time-intensive endeavor, suggesting that enslaved cooks worked around the cooking fires for extended periods of time. Here, in this space (relatively) free from flies and mosquitos, children watched their mothers cook and hungry neighbors gathered to enjoy the smells of food and each other's company. The last chapter discussed social bonds that formed through the food cooked in repurposed pans, and these activities took place around the fire pits. ${ }^{95}$ The multitude of connections maintained in yards created understandings of enslaved people's humanities that

[^79]

Figure 49. Interpolation maps showing the distribution of faunal remains (animal bone and oyster shell) by count and weight. The block of units in the center of the map is the location of House Site 1. The smaller block to the north contains the three fire pits. Maps generated using inverse distance weighting (IDW) interpolation using four nearest points. Data presented in Appendix H, Table 2. Map by author.
emphasized social relationships and the differences between individuals, which ran counter to enslavers' assertion that Black women, children, and men were without differentiation and interchangeable (i.e., fungible) (Hartman 1997; T. L. King 2019; Snorton 2017; Spillers 1987). Put another way, the yard around House Site 1 was an area where enslaved people engaged in an ontological counter-politics by redefining their humanities in ways that redressed (sensu Hartman 1997) some of the pain and alienation of slavery. And it was enslaved women who made and maintained the yards that engendered these politics.

Enslaved people also engaged in counter-politics by using yards and trash scatters to create alternative formations of order, with clearly demarcated areas for congregating and discarding trash (e.g., Edwards 1998; Gifford-Gonzalez 2014; K. K. Harris 2020; Mintz 1974; Parry 2018; Pulsipher 1993). Women, children, and men at Belle Grove even used different trash scatters for different types of refuse, primarily throwing food remains away in the midden south

Figure 50. Interpolation maps of the distribution of pearlware and whiteware sherds by count. The block of units in the center of the map is the location of House Site 1. The smaller block to the north contains the three fire pits. Maps generated using inverse distance weighting (IDW) interpolation using four nearest points. Data presented in Appendix H, Table 2. Map by author.
of the yard (Midden 1) (Figure 49). The distribution of ceramic pearlware and whiteware sherds indicated that enslaved women and men maintained this order for decades (Figure 50). Pearlware is a British refined earthenware sold between the 1780 s and 1820 s, while whiteware is a related ceramic that replaced pearlware in the 1820s. The two types of ceramics were generally found in the same areas of the site, House Site 1, indicating that these parts of the site were used for discarding broken ceramics before and after the 1820s. Both pearlware and whiteware are relatively uncommon in the yard, indicating that its general shape remained the same as daughters and nieces took over the chore of sweeping from mothers and aunts.

The logics driving these reorganizations of the plantation landscape were probably incomprehensible to enslavers (Edwards 1998; McKee 1992, 207; also see Wynter 1987; 1990). But the ways enslaved women arranged the landscape likely created "shoals" (sensu T. L. King 2019) that disrupted enslavers' ideas about order and rationality. Enslavers frequently
complained about the trash that accumulated in quartering sites (A Planter 1836; Barksdale 1856; Carolina Planter 1840; Edwards 1998, 255, 263; L.M. 1860; McKee 1992, 203; Southern Planter 1858). I do not have data that directly speak to these discourses playing out at Belle Grove, but they were printed in agricultural journals distributed throughout the Valley (see Chapter 6), including journals the Hites' grandchildren contributed to (e.g., I. I. Hite 1851; 1853; 1857), suggesting that they were probably aware of these broader discussions. Given this, it is likely that the alternative formations of order created by enslaved women, brooms, and neatly demarcated trash scatters chaffed the Hites' sensibilities and the notions of order they tried to impose on the landscape (T. L. King 2019; also see Macharia 2019; Tinsley 2008; Tsing 2005).

Enslavers began finding ways to navigate these shoals by the 1840s, with articles in agricultural journals advocating for collecting and composting trash from quartering sites and using it as a fertilizer for agricultural fields (A Planter 1836; Carolina Planter 1840; Pendleton 1856; Southern Planter 1846a; 1849; 1848; 1850). This let enslavers see themselves as fully human, capable of creating order and profit from what they considered to be enslaved people's irrational living conditions, while simultaneously arguing that enslaved people were incapable of doing so, hence the supposed need to remove trash from quartering sites to transform it into something of value. I do not know if the Hites forced enslaved people to collect trash from Quarter Site B and redeposit it in the plantation's fields. But as with before, they were probably aware of these recommendations, and if nothing else, may have let their gazes linger on the trash scatters, seeing them not as part of an organizational schema that shaped life at the quarter but an agricultural resource they could harness to increase crop yields and a discursive resource they could use to define themselves as rational human beings.

## Chaos from Order

The more [an assemblage] works in favor of an oppressive order, the more it calls forth disorder as well.
(Glissant 1997, 138)
Enslaved women at Quarter Site B were not alone in disrupting the Hites' ideas of order. At some point in the 1850 s, the bricks used to racialize the plantation landscape joined in as well (also see Reilly 2016). Addressing this brings us back to the devastating fire that destroyed House Site 1. Bringing this into focus requires addressing the physical qualities of the building materials used for the chimney and the qualities of the materials that were not used (Khatchadourian 2016; also see Edensor 2011; Hodder 2012).

As noted earlier, most homes enslaved Virginians built for themselves had stick and mud chimneys that leaned outward from the building, held up by several poles (Figure 47). While their interiors were lined with mud to prevent fires, many eventually went up in flames (J. Taylor $1814,123)$. This is where the angle of the chimney and its supporting poles come in. Enslaved people designed wooden chimneys so that if the poles were knocked down, a blazing chimney would fall away from a house, saving the structure (e.g., Edwards 1998, 254). Brick chimneys, alternatively, are rigid, stable things made from an inflammable material. In other words, their physical properties are vastly different than those of wooden chimneys. As a result, they should prevent chimney fires, and enslavers often preferred them for this reason (J. Taylor 1814, 123). But while bricks are inflammable, chimneys can become lined with creosote, a highly flammable residue found in soot deposits that can catch fire if sparks travel up a chimney and land on it. As far as I can tell, this was probably what caused the house fire.

Table 28. Firing temperature of local-made earthenware vessels. Samples include all earthenwares from Quarter Site B used in the neutron activation analysis (see Chapter 7). Dataset presented in Appendix H, Table 3.

| Temperature | Number of Vessels | Percentage |
| :---: | :---: | :--- |
| $950^{\circ} \mathrm{C}$ | 25 | $21.58 \%$ |
| $1,000^{\circ} \mathrm{C}$ | 5 | $20.14 \%$ |
| $1,050^{\circ} \mathrm{C}$ | 13 | $10.07 \%$ |
| $>1,050^{\circ} \mathrm{C}$ | 21 | $44.60 \%$ |

Evidence for burning (blackened soil, copious deposits of charred wood, and burnt artifacts) is most visible in and around the chimney fall, suggesting that the fire originated in the chimney (see Figure 46). Furthermore, refiring experiments on 64 locally-made earthenware ceramic vessels from Belle Grove have shown that all were fired to at least $950^{\circ} \mathrm{C}$ in local kilns, and $60.93 \%$ were fired at $1,000^{\circ} \mathrm{C}$ or higher (Table 28). During the fire, sherds from two local earthenware vessels became refired, indicating that temperatures reached at least $900^{\circ} \mathrm{C}$, and probably over $1,000^{\circ} \mathrm{C}$. Temperatures this high are difficult to reach in a house fire. Peter Thy et al. (2018) have shown that an Iron-Age house fire in Denmark reached over $1,000^{\circ} \mathrm{C}$, but they suggest that the fire was intentionally set after the house was abandoned, with its former inhabitants likely adding fuel and manipulating airflow to increase temperature. ${ }^{96}$ That was probably not the case at House Site 1, as we recovered a lot of household items in the debris, including ceramics, glass bottles, decorated tobacco pipes, and an intact pocket knife, indicating that the house burned while inhabited. And the cabin's residents were probably not fueling the fire that consumed their home. Creosote, on the other hand, can burn up to $1,100^{\circ} \mathrm{C}$ (Crewell n.d.; Fireplace Mall 2011; High's Chimney Service n.d.; Woodenden n.d.), which is hot enough

[^80]to refire locally-made earthenwares. As a result, the fire that destroyed House Site 1 probably started as a creosote fire in the chimney.

I do not know how the Hites reacted to this fire. But if descriptions of other housefires in Virginian quarters are any indication (e.g., Shepherdstown Register 1855b), they may have blamed it on enslaved people's (supposed) "intemperance" and "intoxication," thereby reproducing the discourses used to justify increasing restrictions on enslaved people's consumption practices (see Chapter 7). Yet, the Hites bear much of the blame for the devastation caused by the fire, as it was their decision about building materials, racialization, and how to organize what they considered to be an orderly landscape that led to House Site 1 going up in flames. Once the creosote ignited, the rigidness of bricks and mortar ensured that the chimney could not be quickly removed from the cabin to save the house. The closest spring was too far away to get enough water to extinguish the fire (see Chapter 9). As a result, there was nothing the cabin's residents could do to stop the fire from destroying their home. This scene of utter chaos, with mothers frantically seeking out their children, neighbors rushing over to help, smoke filling the air, and the helplessness imposed on enslaved women and men by the physical qualities of the brick chimney was made possible by the ways the Hites chose to materialize racializing discourses at Belle Grove.

In the end, the bricks worked against the Hites, burning down part of the ordered landscape they used the chimney to create. But this is not a positive story about things' physical characteristics foiling racializing discourses - a celebration of things' agentic capabilities to affect the world around them often seen in archaeological discussions of materiality and the new materialism (e.g., Hodder 2012; Olsen 2010; Olsen et al. 2012; Pétursdóttir and Olsen 2018; Witmore 2014; also see Bennett 2010). Like last chapter's discussion of lead poisoning from
storage vessels, this is a reckoning with the (at times inadvertent) ways materials destroy(ed) Black lives in the Americas (e.g., Chen 2012; Fouché 2006b). The chimney and the bricks that composed it negatively impacted the lives of enslaved people at Belle Grove for decades by helping to reiterate the racializing discourses that perpetuated slavery. And these bricks and the mortar that held them together continued to harm these women, children, and men as its rigidity ensured that it could not be removed from House Site 1. The chimney provided unique ways for enslaved people to create their own formations of order and humanity by putting a quartz crystal in or around it. But ultimately these counter-politics could not protect them from the oppressive weight of anti-Blackness that the Hites wove into the very landscape of Belle Grove and the materials through which they enacted this violence.

It is with this tragic event that I end my study of enslaved life in the Shenandoah Valley. In many ways, this is a fitting place to stop. The house fire erased House Site 1 from the landscape. The passage of time took its toll on the rest of Quarter Site B, leaving one cabin standing by 1900 (Figure 51), which was demolished in the 1920s to turn the area into a cow field (Geier and Tinkham 2006a, 90). The site remained in pasture and out of local histories until archaeologists surveyed the field in the 1990s and located Quarter Site B, although it did not play a role in reshaping public narratives at Belle Grove until we excavated the site in 2015-2019. In this regard the site is a microcosm of how enslaved life has been treated in the Shenandoah Valley - erased from memory in the late- $19^{\text {th }}$ and early- $20^{\text {th }}$ centuries, rediscovered in the 1990s, but not fully investigated until recently (see Chapter 1). As I have (hopefully) shown throughout Assembling Enslaved Lives, despite the erasure of enslaved women, children, and men from local histories, their actions contributed to and helped shape the region. The final chapter looks at steps that can be taken to ensure these stories cannot be severed from Valley histories again.

Figure 51. Cedar Creek Battlefield, showing Belle Grove House in the distance, near Middletown and Winchester, Va., by Frederick Barr. Inset shows the one surviving cabin at Quarter Site B and the barn at the adjacent agricultural complex. Structures in the middle of the inset are on the manor house grounds. ## Conclusion: From Black History to Valley History

About a decade after the chimney fire destroyed House Site 1, the Shenandoah Valley was engulfed in the American Civil War (1861-1865). Fires spread throughout the region, especially in 1864 when the United States (U.S.) Army burned most of the Valley's agricultural infrastructure to starve the Confederate States into submission. We cannot talk about these events without discussing slavery. White Shenandoahans took up arms, killing in the name of white supremacy and dying to protect the political economies of slavery. Formerly enslaved men enlisted in the U.S. Army, fighting to free others. What we get with the Civil War are five years where it is (or at least should be) impossible to study white history or Black history. Instead, we just have Valley history, encompassing the hopes and aspirations, the frustrations and pained screams of everyone in the region.

Assembling Enslaved Lives has been trying to make a similar set of connections for the 70 years preceding the Civil War when slavery flourished in the Shenandoah Valley. I focused extensively on enslaved women, children, and men, but I did this because it was impossible to tell a truly inclusive Valley history given the inadequate way scholars had talked about slavery in the region. Not enough was known about enslaved people. Now that the dissertation is done, I do not want to argue that we know everything about their lives. But we do have enough to begin retelling Valley history in ways that use the region's political economies as a connective thread that unites the stories of enslaved people with enslaving and non-enslaving white Shenandoahans. Enslavers like the Hites reaped profits from the flesh of Black women, children, and men. Enslaved people found ways to latch onto these political economies, selling extra food and acquiring things from merchants and potters to redress the pain, suffering, and alienation of
slavery. Non-enslaving white Shenandoahans profited from enslaved people's labor and their need to buy things to survive slavery, even if enslavers found ways to coerce them into limiting their interactions with enslaved people.

Retelling Valley history so that it is the story of White and Black Shenandoahans, so that the lives of enslaved women, children, and men are inescapable when recounting early- to mid$19^{\text {th }}$-century history is vitally important. The only way to prevent enslaved people from being erased again is to ensure that they are so tightly woven into our stories that local histories cease to make sense without acknowledging them. My intention is that this dissertation will help with this process, getting scholars and researchers to rethink the lives of enslaved Shenandoahans. But the bigger hurdle is to bring the public into these discussions, especially since after three decades of research on slavery in the Shenandoah Valley, the view that slavery did not really matter in local history persists. As academic work that often digresses into theoretical and methodological asides, Assembling Enslaved Lives is not the ideal vehicle for this. Instead, this job is better suited for teachers and local museums who can reach more people than I possibly can, even if the dissertation was written in a more accessible manner. This process has already begun. In March 2022, Belle Grove launched a new permanent exhibit entitled "Uncovering Enslaved Lives at Belle Grove" which presents my findings in a more accessible manner. As part of the creation of this exhibit, the initial plan and all exhibit materials were reviewed and approved by an advisory committee primarily comprised of Blacks scholars. And over the past seven years, I have given 14 public lectures and invited talks at venues in the Valley to aiming at informing Shenandoahans about the work we have done at Quarter Site B. It is my hope that these efforts can continue in the coming years, and that myself and other member of the archaeology team can collaborate with public historians at other museums in the Valley to disseminate our findings in
future exhibits. Retelling local history is not the only goal of Assembling Enslaved Lives. I also strove to offer new ways of thinking about slavery that draws from Black studies. This, I feel, is something that the dissertation was more successful at, although here too I probably failed to fully accomplish my goal. There are simply too many complex issues at stake to address everything. I am sure some of my discussions did not land as (well as) I intended, especially since I interpreted scholars like Sylvia Wynter, Tiffany King, or Saidiya Hartman in ways that made sense to me and the materials I worked with. Others, surely, will disagree with the choices I made. But I hope that they will at least engage with the ideas presented in the dissertation when critiquing it, allowing this to be a step towards a broader counter-humanist approach to the archaeology of enslaved life, one that lets us find new ways of studying slavery that fit with the Black Lives Matter era we are in.

## Appendix A: Supplementary Data for Chapter 1

Table 1: 1840 Agricultural Census Data, Virginia, and Maryland
This table contains data from the 1840 Agricultural Census used in the discussion of wheat production in Chapter 1. VA indicates data for counties in Virginia and MD indicates data for counties in Maryland. Counties in bold are in the Shenandoah Valley. All data acquired from the IPUMS National Historical Geographic Information System: Version 15.0 (Manson et al, 2020), and was accessed on 29 November 2020.

Table 3: 1860 Agricultural Census Data, Virginia, and Maryland
This table contains data from the 1860 Agricultural Census used in the discussion of wheat production in Chapter 1. VA indicates data for counties in Virginia and MD indicates data for counties in Maryland. Counties in bold are in the Shenandoah Valley. All data acquired from the IPUMS National Historical Geographic Information System: Version 15.0 (Manson et al, 2020), and was accessed on 29 November 2020.

| State | County | Wheat (Bushels) | $\begin{gathered} \text { Rye } \\ \text { (Bushels) } \end{gathered}$ | Wheat Value (Dollars) | Total Agricultural Value (Dollars) |

Table 4: Enslaved People per Household, Frederick County 1810
This table contains aggregated data from the 1810 Federal Census on the number of enslaved people per household in Frederick County. It includes the total number of households enslaving different amounts of enslaved people and the total number of people enslaved by these households. In total, the table includes data on 2,655 households, of which 825 (31.07\%) enslaved people. The bolded row indicates Isaac Hite, Jr's household. Hite owned Belle Grove Plantation in 1810. Data was transcribed from John Vogt's transcription of the census (2007).

Table 7: Enslaved People per Household, Frederick County 1840
This table contains aggregated data from the 1840 Federal Census on the number of enslaved people per household in Frederick County. It includes the total number of households enslaving different amounts of enslaved people and the total number of people enslaved by these households. In total, the table includes data on 1,860 households, of which 490 (26.34\%) enslaved people. An entry for Ann T. Hite has not been found in the 1840 Census. Hite owned Belle Grove Plantation in 1840. The bolded row includes the household of Isaac Fountain Hite, a son of Isaac and Ann Hite who inherited the Rockville Tract.

| People Enslaved per Household | Number of Households | Number of Enslaved People | Cumulative Percent of Enslaving Households | Cumulative Percent of Enslaved People |

## Table 8: Enslaved People per Household, Clarke County 1840

This table contains aggregated data from the 1840 Federal Census on the number of enslaved people per household in Clarke County. It includes the total number of households enslaving different amounts of enslaved people and the total number of people enslaved by these households. In total, the table includes data on 537 households, of which $309(57.54 \%)$ enslaved people. The bolded row includes the household of James Madison Hite, the eldest son of Isaac and Ann Hite who inherited the Guilford Plantation.

| People Enslaved per Household | Number of Households | Number of Enslaved People | Cumulative Percent of Enslaving Households | Cumulative Percent of Enslaved People |

Table 9: Enslaved People per Household, Frederick County 1850
This table contains aggregated data from the 1850 Slave Schedule on the number of enslaved people per household in Frederick County. It includes the total number of households enslaving different amounts of enslaved people and the total number of people enslaved by these households. In total, the table includes data on 462 households. However, these have not been cross-referenced with the total number of households in Frederick County from the 1850 Census, so the percentage of households enslaving people cannot be calculated. The bolded row indicates Ann T. Hite's household. Hite Owned Belle Grove Plantation in 1850.

Table 11: Enslaved People per Household, Frederick County 1860
This table contains aggregated data from the 1860 Slave Schedule on the number of enslaved people per household in Frederick County. It includes the total number of households enslaving different amounts of enslaved people and the total number of people enslaved by these households. In total, the table includes data on 300 households. However, these have not been cross-referenced with the total number of households in Frederick County from the 1860 Census, so the percentage of households enslaving people cannot be calculated. The bolded row for 16 enslaved people includes the household of Isaac Fountain Hite, a son of Isaac and Ann Hite who inherited the Rockville Tract. The bolded row with five enslaved people includes John and Benjamin Cooley, who owned Belle Grove Plantation in 1860.

| People Enslaved per Household | Number of Households | Number of Enslaved People | Cumulative Percent of Enslaving Households | Cumulative Percent of Enslaved People |

## Appendix B: Supplementary Data for Chapter 2

## Table 1: Entries from Frederick County, 1853-1860

This table contains all entries for enslaved men in the Frederick County Death Registry between 1853 and 1860. It also contains all entries in the Death Registry for White men who have their occupation listed between 1853 and 1859. All data obtained from Dee Ann Buck's transcription of the Death Registry (Buck 1997a). Page numbers refer to pages in Buck's transcription.

Table 2: Entries from Shenandoah County, 1853-1860
This table contains all entries for enslaved men in the Shenandoah County Death Registry between 1853 and 1860. It also contains all entries in the Death Registry for White men who have their occupation listed between 1853 and 1859. All data obtained from Dee Ann Buck's transcription of the Death Registry (Buck 1997b). Page numbers refer to pages in Buck's transcription.

Table 3: Entries from Warren County, 1853-1860
This table contains all entries for enslaved men in the Warren County Death Registry between 1853 and 1860. It also contains all entries in the Death Registry for White men who have their occupation listed between 1853 and 1859. All data obtained from Dee Ann Buck's transcription of the Death Registry (Buck 1996). Page numbers refer to pages in Buck's transcription.

| Status | Name | Year | Month | Cause | Age | Occupation | Page |

## Appendix C: Supplementary Data for Chapter 4

## Table 1. Isaac Hite Land Transfers

The following are all entries for Isaac Hite (or his estate) buying, selling, or exchanging agricultural land in Frederick County, as recorded in Dee Ann Buck's seven-volume set of transcribed entries from the Frederick County Deed Books (Buck 2007a; 2007b; 2007c; 2007d; 2008; 2009; 2010). While Hite also bought and sold lots in Valley towns, and sold land in Adams County, Ohio, these were not included in this list as these acquisitions were unlikely to affect the people Hite enslaved. Several purchases or sales referenced in the following entries are not found in Buck's transcriptions, and as such, this is not to be considered a definitive list of all the Frederick County land deals Hite was involved in, but a sample which shows some of the general trends in his land acquisitions. In an attempt to gain a larger sample size, transactions recorded by Blosser (n.d) were also included (this includes transfers detailed in the wills of Isaac Hite Sr. and Jr.). Deed books from Shenandoah County have not yet been consulted, and as Hite held land in this county as well, these books may provide additional details on Isaac Hite's land transactions.

| Year | Grantor | Grantee | Cost | Acres Gained | Acres Lost | Location | Source |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1783 | Hite, Isaac Sr. | Hite, Isaac Jr. | 5 shillings | 483 |  | Belle Grove | (Buck 2007a, 139) |
| 1794 | Brown, Hugh | Hite, Isaac Jr. | £1,000 | 400 |  | Buffalo Marsh | (Buck 2007b, 21) |
| 1794 | Hite, Isaac Sr. | Hite, Isaac Jr. | Inheritance | 4.75 |  | Belle Grove | (Blosser n.d, 27) |
| 1794 | Hite, Isaac Sr. | Hite, Isaac Jr. | Inheritance | 1,528 |  | Long Meadow | (Blosser n.d, 27) |
| 1794 | Hite, Isaac Sr. | Hite, Isaac Jr. | Inheritance | 180 |  | South River, Shenandoah Cty. | (Blosser n.d, 28) |
| 1799 | Waton, Josiah | Hite, Isaac Jr. | \$6,000 | 595 |  | Rockville | (Blosser n.d, 37) |
| 1799 | Snider, Daniel | Hite, Isaac Jr. | \$1,333.34 | 208 |  | Cedar Creek | (Blosser n.d, 39) |
| 1801 | Snider, Daniel | Hite, Isaac Jr. | £400 | 14 |  | Cedar Creek | (Buck 2007c, 250) |
| 1803 | Goodekoontz, Jacob | Hite, Isaac Jr. | \$2,635 | 298 |  |  | (Buck 2008, 103) |
| 1805 | Hoge, Moses | Hite, Isaac Jr. | \$3,333.33 | 207 |  | Cedar Creek | (Buck 2007c, 120) |
| 1805 | Laney, John | Hite, Isaac Jr. | \$1,000 | 129 |  | Crooked Run | (Buck 2007c, 141) |
| 1805 | Taylor, James Taylor, Jesse | Hite, Isaac Jr. | 1,091 Acres in Ohio | 476 |  | Guilford | (Blosser n.d, 42) |
| 1806 | Bowman, Isaac | Hite, Isaac Jr. | Exchange | 161 | 22 | Long Meadow | (Buck 2007c, 39) |
| 1806 | Booth, Rebecca? | Hite, Isaac Jr. | Not recorded |  |  |  | (Buck 2007c, 118) |
| 1806 | Taylor, Jesse | Hite, Isaac Jr. | \$1,500 | 205 |  | Guilford | (Buck 2007c, 266) |
| 1806 | Taylor, William | Hite, Isaac Jr. | £100 | 272 |  | Guilford | (Buck 2007c, 268) |
| 1806 | Weaver, Jacob | Hite, Isaac Jr. | £480 | 269 |  | Long Meadow | (Buck 2007c, 287) |
| 1810 | Davis, Stephen | Hite, Isaac Jr. | \$1 | 79 |  | Guilford | (Buck 2007c, 69) |
| 1810 | Goodekoontz, George | Hite, Isaac Jr. | \$2,000 | 100 |  | Belle Grove | (Buck 2007c, 96) |
| 1810 | Goodekoontz, George | Hite, Isaac Jr. | \$2,000 | 115 |  |  | (Buck 2007c, 96) |
| 1811 | Cartmell, Nancy | Hite, Isaac Jr. | \$11,973.50 | 477.5 |  | Rockville | (Buck 2007c, 51) |

| Year | Grantor | Grantee | Cost | Acres Gained | Acres Lost | Location | Deed Book |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1811 | Mauck, Daniel | Hite, Isaac Jr. | Not Given | 320 |  |  | (Buck 2007c, 171) |
| 1811 | Mauck, George | Hite, Isaac Jr. | \$95 | 3.4 |  |  | (Buck 2007c, 172) |
| 1812 | Everly, Jeremiah | Hite, Isaac Jr. | \$600 | 320 |  | Cedar Creek | (Buck 2007c, 84) |
| 1814 | Hite, Isaac, Jr. | Bladwin, Cornelius | \$1 |  | 477.5 | Long Meadow or Belle Grove | (Buck 2007d, 118) |
| 1816 | Hite, Isaac, Jr. | Rogers, Samuel | \$10 |  | 6.25 |  | (Buck 2007d, 118) |
| 1818 | Hite, Isaac, Jr. | Tilden, John | £310.5 |  | 103.5 | Opeckon Creek | (Buck 2007d, 118) |
| 1818 | Niswander, Abraham | Hite, Isaac Jr. | \$68.75 | 1.25 |  | Buffalo Marsh | (Buck 2007d, 186) |
| 1823 | Hite, Isaac Jr. | Hite, James | \$1 |  | 1,104 | Guilford | (Buck 2008, 130) |
| 1830 | Hite, Isaac Jr. | Long, Reuben | \$1 |  | 7.25 | Belle Grove | (Buck 2009, 126) |
| 1831 | Hite, Isaac Jr. | Stickley, David | \$50 |  | 7 | Long Meadow | (Buck 2009, 127) |
| 1831 | Hite, Isaac Jr. | Mahaney, Joseph | \$1 |  | 30.75 | Cedar Creek | (Buck 2009, 127) |
| 1833 | Hite, Isaac Jr. | Hay, John |  |  | 71 | Hay's Farm | (Buck 2009, 127) |
| 1833 | Mowry, Frederick | Hite, Isaac Jr. | Exchange | 10.5 | 11.5 |  | (Buck 2009, 204) |
| 1836 | Hite, Isaac Jr. | Hite, Isaac F. | Inheritance |  | 850 | Rockville | (Blosser n.d, 77-78) |
| 1836 | Hite, Isaac Jr. | Hite, Walker | Inheritance |  | 850 | Rockville | (Blosser n.d, 77-78) |
| 1836 | Hite, Isaac Jr. | Hite, Hugh | Inheritance |  |  | Belle Grove | (Blosser n.d, 78) |
| 1836 | Hite, Isaac Jr. | Hite, Hugh | Inheritance |  | 124 | Shenandoah Cty. | (Blosser n.d, 78) |
| 1836 | Hite, Isaac Jr. | Hite, Cornelius | Inheritance |  |  | Belle Grove and Long Meadow | (Blosser n.d, 78) |
| 1836 | Hite, Isaac Jr. | Hite, Ann | Inheritance |  | 560 | Shenandoah Cty. | (Blosser n.d, 79) |
| 1836 | Hite, Isaac Jr. | Hite, Nelly | Inheritance |  | 15 | Belle Grove | (Blosser n.d, 79) |
| 1836 | Hite, Isaac Jr. | Baldwin, Cornelius | Exchange | 8 | 8 | Long Meadow | (Blosser n.d, 80) |
| 1836 | Hite, Isaac Jr. | Hite, Mary | Inheritance |  |  | Long Meadow | (Blosser n.d, 82) |
| 1836 | Hite, Isaac Jr. | Hite, Rebecca | Inheritance |  |  | Long Meadow | (Blosser n.d, 82) |
| 1836 | Hite, Isaac Jr. | Hite, Sarah | Inheritance |  |  | Long Meadow | (Blosser n.d, 82) |
| 1836 | Hite, Isaac Jr. | Hite, Betsey | Inheritance |  |  | Long Meadow | (Blosser n.d, 82) |
| 1836 | Hite, Isaac Jr. | Hite, Matilda | Inheritance |  |  | Long Meadow | (Blosser n.d, 82) |
| 1841 | Hite, Isaac Jr., (Ann Hite), James Turner, and Addison Turner | Turner, Robert | \$500 |  | 200 | Cedar Creek | (Buck 2010, 121) |
| 1841 | Hite, Isaac Jr. (Ann Hite) | Mahaney, Joseph | Exchange | 40 | 32 | Belle Grove | (Buck 2010, 121) |

Table 2. Artifact Categories from Quarter Site B Excavations, 2015-2019
This table provide s a breakdown of the artifacts from Quarter Site B by type. ACC\# is the artifact catalog code number, an internal numbering system used in the project database.

| ACC\# | Category | Group | Type | Specifics | Count |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1045 | Architecture | Building Part | Construction Debris | Limestone Spall | 39 |

## Appendix D: Supplementary Data for Chapter 5

Table 1: Transcribed tasks from Francis Jones journal
This table contains all the tasks transcribed from the Francis Jones Journal (1860), which was used to establish the annual cycle for enslaved farmers in the Valley.

| Year | Month | Day | Transcribed Task |
| :---: | :---: | :---: | :---: |
| 1850 | April | 6 | Illegible Straw |
| 1850 | April | 6 | Sawing Timber |
| 1850 | April | 8 | Repairing Building |
| 1850 | April | 8 | Plowing |
| 1850 | April | 9 | Burning Brush |
| 1850 | April | 9 | Plowing |
| 1850 | April | 10 | Splitting Illegible |
| 1850 | April | 10 | Hauling Rails |
| 1850 | April | 10 | Plowing |
| 1850 | April | 11 | Hauling Rails |
| 1850 | April | 11 | Mending Fence |
| 1850 | April | 12 | Plowing |
| 1850 | April | 13 | Plowing |
| 1850 | April | 15 | Plowing |
| 1850 | April | 16 | Plowing |
| 1850 | April | 17 | Plowing |
| 1850 | April | 18 | Grubbing |
| 1850 | April | 18 | Plowing |
| 1850 | April | 19 | Hauling Straw |
| 1850 | April | 19 | Grubbing |
| 1850 | April | 19 | Plowing |
| 1850 | April |  | Planting Illegible |
| 1850 | April |  | Sowing Plaster |
| 1850 | August | 1 | Illegible Wheat |
| 1850 | August | 6 | Grubbing |
| 1850 | August | 7 | Chopping Briars |
| 1850 | August | 8 | Grubbing |
| 1850 | August | 8 | Chopping Briars |
| 1850 | August | 9 | Grubbing |
| 1850 | August | 10 | Chopping Briars |
| 1850 | August | 12 | Grubbing |
| 1850 | August | 12 | Chopping Briars |
| 1850 | August | 13 | Illegible Rails |
| 1850 | August | 13 | Grubbing |
| 1850 | August | 13 | Chopping Wood |

| Year | Month | Day | Transcribed Task |
| :---: | :---: | :---: | :---: |
| 1850 | August | 13 | Hauling Corn |
| 1850 | August | 20 | Grubbing |
| 1850 | August | 20 | Harrowing |
| 1850 | December | 7 | Working in Shop |
| 1850 | December | 12 | Hauling Illegible |
| 1850 | December | 12 | Pulling Off Corn |
| 1850 | December | 13 | Digging |
| 1850 | December | 13 | Grading |
| 1850 | February | 19 | Plowing |
| 1850 | February | 20 | Plowing |
| 1850 | February | 21 | Plowing |
| 1850 | February | 22 | Plowing |
| 1850 | February | 23 | Ditching |
| 1850 | February | 23 | Plowing |
| 1850 | February |  | Cutting Stakes |
| 1850 | February |  | Digging Thistle |
| 1850 | February |  | Ditching |
| 1850 | February |  | Digging Onions |
| 1850 | February |  | Hauling Manure |
| 1850 | February |  | Hauling Rails |
| 1850 | February |  | Plowing |
| 1850 | January | 1 | Repairing Building |
| 1850 | January | 1 | Repairing Old House |
| 1850 | January | 1 | Repairing Stables |
| 1850 | January | 1 | Chopping Wood |
| 1850 | January | 1 | Hauling Wood |
| 1850 | March | 3 | Sowing Clover |
| 1850 | March | 3 | Plowing |
| 1850 | March | 4 | Sowing Clover |
| 1850 | March | 15 | Sowing Clover |
| 1850 | March | 18 | Planting Illegible |
| 1850 | March | 19 | Hauling Manure |
| 1850 | March | 19 | Planting |
| 1850 | March | 21 | Sowing Clover |
| 1850 | March | 21 | Sowing Oats |
| 1850 | March | 21 | Sowing Plaster |
| 1850 | March | 22 | Illegible Clover |
| 1850 | March | 22 | Illegible Oats |
| 1850 | March | 22 | Plowing |
| 1850 | March | 23 | Splitting Illegible |
| 1850 | March | 26 | Repairing Building |
| 1850 | March | 26 | Hauling Rails |

| Year | Month | Day | Transcribed Task |
| :---: | :---: | :---: | :---: |
| 1850 | March | 27 | Hauling Manure |
| 1850 | March | 27 | Making Stakes |
| 1850 | March | 28 | Hauling Stakes |
| 1850 | March | 28 | Mending Fence |
| 1850 | March | 30 | Sowing Oats |
| 1850 | November | 4 | Illegible Wheat |
| 1850 | November | 4 | Plowing Corn |
| 1850 | November | 8 | Plowing |

Table 2: Transcribed entries from Hopewell Mill, 1807-1811
This table contains all the transcribed entries for the sale of corn, oats, rye, wheat, and flour in the Hopewell Mill 1807-1811 ledger (Hopewell Mill 1811). Not all entries contained the amount of grain/flour and the dollar value of the grain/flour. However, when the price per bushel could be reasonably established from the surrounding entries it was included in the Dollar column. The enslaver column is for accounts that could be cross-referenced to 1807, 1809, 1810, and 1811 Jefferson County tax records (Duncan 2003a). Those listed as paying taxes on enslaved men in the year in which the entry was made are listed as enslavers and those not listed as paying taxes on enslaved men are listed as not being enslavers. Accounts with no data in this column could not be cross-referenced to the tax records. This data was used to determine the relative amount of grain/flour sold by enslavers and non-enslavers in 1807-1811.

| Year | Day | Account | Action | Item | Barrel | Bushel | Dollars | Enslaver |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1807 | 1/12 | Davenport, Samuel | Sold | Flour | 34 |  | 170 | Yes |
| 1807 | 1/13 | Conkland, Henry | Sold | Corn |  | 1.75 | 1.185 | No |
| 1807 | 1/30 | Whitlock, James | Sold | Wheat |  | 6 |  |  |
| 1807 | 8/17 | Watson, James | Sold | Wheat |  | 44.5 | 33.375 | No |
| 1807 | 8/17 | Watson, James | Sold | Wheat |  | 53 | 39.75 | No |
| 1807 | 8/17 | Williams, ? | Sold | Wheat |  | 2 |  |  |
| 1807 | 8/26 | Vanmeter, Abraham | Sold | Wheat |  | 9 | 7.2 | No |

Table 3: Transcribed entries from Hopewell Mill, 1817
This table contains all the transcribed entries for the sale of corn, rye, oats, and wheat at Hopewell Mill in 1817 (Hopewell Mill 1818). Entries for flour bought from farmers and barrels of flour waggoneers were paid to transport to Alexandria and Baltimore are recorded in the same way, so flour entries are not included in this table. Only three entries contained dollar values, so dollar values are not included in this table. The column for enslaved people over the age of 12 was obtained using data from the 1817 Jefferson County Tax Records. Accounts with no data in this column could not be cross-referenced to the tax records (Duncan 2003b). This data was used to determine the relative amount of grain/flour sold by enslavers and non-enslavers in 1817.

Table 4: Transcribed entries from Spring Mill, 1823-1835
This table contains all the transcribed entries for the sale of corn, oats, rye, wheat, and flour in the Spring Mill 1823-1835 ledger (Spring Mill 1830). Not all entries contained the amount of grain/flour and the dollar value of the grain/flour. However, when the price per bushel could be reasonably established from the surrounding entries it was included in the Dollar column. The enslaver column is for accounts that could be cross-referenced to the 1830 Federal Census. Those listed as enslaving adult women and men are listed as enslavers and those not enslaving adult women and men are listed as not being enslavers. No account belonged to a person who only enslaved children. Accounts with no data in this column could not be crossreferenced to the census. This data was used to determine the relative amount of grain/flour sold by enslavers and non-enslavers in 1823-1835. However, since these have not been crossreferenced with tax records, they cannot provide an in-depth understanding of these trends.

Table 5: Transcribed entries from Spring Mill, 1843
This table contains all the transcribed entries for the sale of corn, oats, rye, wheat, and flour at Spring Mill in 1843 (Spring Mill 1847). Not all entries contained the amount of grain/flour and the dollar value of the grain/flour. However, when the price per bushel could be reasonably established from the surrounding entries it was included in the Dollar column. The enslaver column is for accounts that could be cross-referenced to the 1840 Federal Census. Those listed as enslaving adult women and men are listed as enslavers and those not enslaving adult women and men are listed as not being enslavers. No account belonged to a person who only enslaved children. Accounts with no data in this column could not be cross-referenced to the census. This data was used to determine the relative amount of grain/flour sold by enslavers and non-enslavers in 1843. However, since these have not been cross-referenced with tax records, they cannot provide an in-depth understanding of these trends.

Table 7: Sale and hire advertisements in the Farmers' Repository, Virginia Free Press and Farmers' Repository, and Virginia Free Press

This table contains relevant data from the 595 sale and hiring advertisements placed in the three Charlestown, Virginia papers used to explore sale and hiring trends in the Valley. FR indicates Farmers' Repository (1809-1820), VFPFR indicates Virginia Free Press \& Farmers' Repository (1830-1832), and VFP indicates Virginia Free Press (1832-1841). Deceased enslavers whose estate is advertising for the sale or hire of enslaved people are indicated by (dec) following the enslaver's name.

Table 10: Prices used to establish Alexandria flour prices, 1801-1860
This table contains the price data used to establish the average yearly price Alexandria merchants paid for a barrel of flour. When multiple prices for a single month were available, only the earliest reported price was used unless the earliest price from the preceding month was in the second half of the month, in which case a price from the middle of the month was selected to prevent price points from being too close together. All prices are for superfine flour.

| Date | Price of Flour, per Barrel | Flour Price, Adjusted to 1810 | Paper |
| :---: | :---: | :---: | :---: |
| 1/10/1801 | \$9.50 | \$9.20 | Alexandria Daily Advertizer |
| 2/14/1801 | \$11.00 | \$10.65 | Alexandria Daily Advertizer |
| 6/27/1801 | \$10.83 | \$10.49 | Alexandria Daily Advertizer |
| 7/3/1801 | \$10.75 | \$10.41 | Alexandria Daily Advertizer |
| 8/22/1801 | \$9.10 | \$8.81 | Speculator |
| 9/29/1806 | \$6.25 | \$6.30 | Alexandria Daily Advertizer |
| 10/6/1806 | \$6.50 | \$6.55 | Alexandria Daily Advertizer |
| 11/10/1806 | \$6.50 | \$6.55 | Alexandria Daily Advertizer |
| 12/1/1806 | \$6.42 | \$6.47 | Alexandria Daily Advertizer |
| 1/5/1807 | \$6.16 | \$6.53 | Alexandria Daily Advertizer |

Table 11: Flour brought into Alexandria, Georgetown, and Baltimore, 1830-1860
This table lists the amount of flour brought into Alexandria, Georgetown, and Baltimore. The graphs in Chapter 5 combine Alexandria and Georgetown and only have data for years where imports from both cities are available. Alexandria and Georgetown data from Comp (1978, 273-274, 279-280). Baltimore data from Merchants' Magazine $(1861,132)$ and The American Farmer (1858, 263).

| Year | Alexandria | Georgetown | Baltimore |

Table 12: Average Baltimore foreign exports, 1840-1860
This table has the average amount of flour exported from Baltimore to various foreign ports between 1840-1844, 1845-1850, 1851-1855, and 1856-1860. Data from Rutter (1897, 18).

| Exported To | $\mathbf{1 8 4 0 - 1 8 4 4}$ | $\mathbf{1 8 4 6 - 1 8 5 0}$ | $\mathbf{1 8 5 1 - 1 8 5 5}$ | $\mathbf{1 8 5 6 - 1 8 6 0}$ |

Table 14: Prices used to establish Baltimore flour prices, 1821-1841
This table contains the price data used to establish the average yearly price Baltimore merchants paid for a barrel of flour. When multiple prices for a single month were available, only the earliest reported price was used unless the earliest price from the preceding month was in the second half of the month, in which case a price from the middle of the month was selected to prevent price points from being too close together. Baltimore had multiple flour markets, each with their own prices, but most Valley flour went to the Howard Street Market, as the other major market (City Mills) was for flour milled in Baltimore. When individual markets were specified, Howard Street was used. Often, the prices of "wagon" flour were distinguished from "store" flour, and when this was the case, wagon prices were used as store prices were resale values within the city, while wagon prices were prices paid for flour imported into Baltimore. All prices are for superfine flour when this option was available.

| Date | Price of Flour, per Barrel | Flour Price (1810) | Paper |
| :---: | :---: | :---: | :---: |
| 3/17/1821 | \$4.28 | \$3.94 | Winchester Republican |

## Table 4: Vessel Sets

Vessels sets for vessels identified from Quarter Site B and the Manor House grounds. This includes all vessel sets, not just those used in Chapter 7. Specifically, I include sets for dipt and sponge-decorated vessels which are not included in the analysis in Chapter 7 because these types of vessels were not sold in sets. I included them in the vessel sets solely to compare decoration across the sites in my preliminary analysis. The QSB column is the number of vessels from Quarter Site B that belong to each vessel set and the MHG column is the number of vessels from the Manor House grounds that belong to each set.

| Vessel Set | QSB | MHG | Ware | Vessel Type | Category | Motif | Color |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| VS001 | 2 | 0 | Pearlware | Tableware | Dipt | Marbled |  |

Table 6: NAA Concentration Data, Part 2 (Sc-V)
Concentrations for the last 16 of the 33 elements measured by NAA. All reported values are in parts per million (PPM). In the Site column, QSB is Quarter Site B, JPP is the John Pitman Pottery, APP is the Andrew Pitman Pottery, ABP is the Andrew Pitman Pottery, SSP is the Strasburg Steam Pottery, and PLP is the Peter Lauck Pottery.

## Table 7: Group classification using Mahalanobis Distance

Results of Mahalanobis distance (MD) calculations. All calculations conducted using the first 7 principal components (PCs), which together explain $85.40 \%$ of the variance in the dataset. See Table 8 for PC loading scores. Best group is based on the highest membership probability > $0.001 \%$. In several cases, samples were not placed in the best group (as determined by MD) because of the results of other statistical tests.

| Membership probabilities for samples in group: Group 1 |  |  |  |  |  |  |  |

Table 8: Principal Component Analysis Used in Mahalanobis Distance Calculations Results of the principal component (PC) analysis on the NAA dataset. Only the first seven PCs are reported as these are the only ones used in the analysis. These seven PCs explain $85.40 \%$ of the variance in the dataset.

## Appendix F: Supplementary Data for Chapter 8

Table 1: FTIR Peaks from Imported Vessels
This table contains the complete FTIR dataset from the imported vessels, including both the chipped areas tested for residue and the control samples. Peaks listed as "discard" in the "Discarded?" column were discarded because they belonged to the 21 common peak ranges that are likely due to the extraction solution, the microscope slide, surface contamination, and/or portions of the ceramic body suspended in the extraction solution (also see Table 2). Peaks in this column listed as "residue" did not overlap with peaks seen on control samples and making them the best candidates to be from absorbed residues. Peaks with nothing in this column are control samples or peaks from chipped areas that matched peaks from the control samples. The "Discarded Range" column lists peaks the range of peaks the discarded data was associated with. All peak values in cm-1.

| Sample | Location | Run | Sample Type | Peak | Discard | Discard Peak |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| R004 | R004-1 | R004-1-B1 | Chip | 3060 | Discard | 3070-3055 |

Table 2: FTIR Data Rejected for Being from Commonly Occurring Peaks
This table contains all 21 commonly-occurring peaks from imported ceramics that were removed from the analysis, along with the number of runs that had these peaks. The excluded peaks are presumably from the extraction solution, the microscope slide, surface contamination, and/or portions of the ceramic body suspended in the extraction solution. Peak values are in cm 1.

| Discard Peak | Peaks |
| :--- | ---: |
| $1252-1246$ | 78 |
| $1276-1266$ | 115 |
| $1310-1306$ | 104 |
| $1380-1374$ | 159 |
| $1463-1454$ | 162 |
| $1497-1493$ | 99 |
| $1543-1536$ | 155 |
| $1606-1600$ | 130 |
| $1704-1693$ | 155 |
| $1738-1723$ | 156 |
| $2734-2720$ | 87 |
| $2860-2844$ | 157 |
| $2875-2866$ | 163 |
| $2930-2918$ | 160 |
| $2960-2951$ | 164 |

| $3070-3055$ | 130 |
| $3422-3281$ | 21 |
| $3568-3524$ | 66 |
| $705-695$ | 140 |
| $769-751$ | 158 |
| $913-887$ | 163 |
|  |  |

Table 3: Comparison FTIR Peaks from Chipped Areas and Control Samples
This table contains all of the peaks left in the dataset after the commonly-occur peaks were excluded, along with the control samples. Peak values are in $\mathrm{cm}-1$. Any peak from the Imported Samples that was more than $5 \mathrm{~cm}-1$ from a peak associated with a control sample was considered a residue and analyzed in Chapter 8. Imported Control are control samples from imported ceramics, Local Control 1 are control samples from locally-made utilitarian wares that have "normal" background readings (see Appendix G, Table 2) and Local Control 2 are local utilitarian wares with little to no background readings (see Appendix G, Table 3, also see Chapter 9).

| Peak | Imported Samples | Imported Control | Local Control 1 | Local Control 2 |
| :---: | :---: | :---: | :---: | :---: |

## Table 4: FTIR Reference Library

This table contains the reference library for the FTIR analysis. When the type of chemical bonds present in the listed substance is known, it is listed in the "Bond Type" column. The source of the data is listed in the "Source" column. Any source listed as "data collected by myself" was collected by me during my analysis. These data were obtained by eliminating all peaks that aligned with the commonly occurring peaks (see Table 2 and Appendix G, Table 4), and excluding any peak that was only seen in one of the three runs I analyzed from each substance. The raw data is presented I Table 5. All peak values are in $\mathrm{cm}-1$.

| Peak | Substance | Bond Type | Source |
| :---: | :---: | :---: | :---: |
| 3600-3300 | Starch (General) |  | Abdullah et al. 2018 |
| 3600-3200 | Water | O-H Stretch | Logan and Cummings $2012$ |

## Table 5: Substances Analyzed for Inclusion to Reference Library

This table contains the sample register for the samples taken from substances I analyzed so they could be included in the reference library. Cooked samples refer to substance that were boiled in 50 ml of distilled water for 10 minutes before being tested. Steeped samples are from substance that were boiled in distilled water for five minutes and allowed to cool before 0.2 ml of the liquid was analyzed. The "Amount" column included the amount of the substance (in grams) used in this research. For most sample this was the amount of material included in the glass vial along with the extraction solution. The exception to this are the steeped samples, where the "amount" column indicates the amount of the tealeaves or parched cornmeal placed into the distilled water to be boiled. Bohea, souchong, and congou are black teas, while hyson and singlo are green teas.

| Sample | Substance | Amount (g) |
| :--- | :--- | ---: |
| RL001 | Turnip Root - Raw | 0.335 |
| RL002 | Turnip Root - Cooked | 0.3712 |
| RL003 | Turnip Green - Raw | 0.1171 |
| RL004 | Turnip Green - Cooked | 0.6203 |
| RL005 | Cucumber Skin - Raw | 0.1276 |
| RL006 | Cucumber Flesh - Raw | 0.3256 |
| RL007 | Squash - Raw | 0.322 |
| RL008 | Squash - Cooked | 0.2758 |
| RL009 | Peach Flesh - Raw | 0.0669 |
| RL010 | Plum Flesh - Raw | 0.0339 |
| RL011 | Corn Meal - Raw | 0.0592 |
| RL012 | Corn Meal - Cooked | 0.6797 |
| RL013 | Corn Coffee - Raw | 0.0516 |
| RL014 | Corn Coffee - Steeped | 1.1335 |
| RL015 | Tea Bohea - Raw | 0.0571 |
| RL016 | Tea Bohea - Steeped | 1.6284 |
| RL017 | Tea Souchong - Raw | 0.0338 |
| RL018 | Tea Souchong - Steeped | 1.7896 |
| RL019 | Tea Hyson - Raw | 0.0374 |
| RL020 | Tea Hyson - Steeped | 1.2277 |
| RL021 | Tea Singlo - Raw | 0.0815 |
| RL022 | Tea Singlo - Steeped | 1.8082 |
| RL023 | Tea Congou - Raw | 0.0513 |
| RL024 | Tea Congou - Steeped | 1.8285 |
| RL025 | Cherry Flesh - Raw | 0.0367 |
| RL026 | Cabbage - Raw | 0.0758 |
| RL027 | Cabbage - Cooked | 0.161 |

Table 6: Data from Reference Library Acquired for this Project
This table contains the full FTIR dataset from the foods and beverages I analyzed myself so they could be included in the reference library (Table 3). All data acquired using methods laid out in Chapter 8. Peaks listd as "discard" in the "Discard" column were removed from the analysis for being from the commonly occurring peaks identified in the analysis of the imported and locally-made ceramics (Table 2, Appendix G, Table 4).

| Substance | Sample | Run | Peak | Discard |
| :---: | :---: | :---: | :---: | :---: |
| Turnip Root - Raw | RL001 | RL001-1 | 3358 | Discard |
| Turnip Root - Raw | RL001 | RL001-1 | 2954 | Discard |
| Turnip Root - Raw | RL001 | RL001-1 | 2927 | Discard |

## Table 7: Use-Wear Analysis, Plates

This table contains all the use-wear data from the imported plates from Quarter Site B. Vessel indicates the vessel number, artifact is the catalogue number for each sherd, side is the side of the vessels the wear occurs on, location is where on the vessel the wear occurs, mechanism how the wear was produced, trace is the type of wear on the vessel, top edge is the shape of the wears' top edge, edge wear is the amount of abrasive wear on the trace's top edge, orientation is the direction of the wear relative to the vessels, and length and width are the size of the trace, listed in millimeters. For additional explanation, see Chapter 8.

| Vessel | Artifact | Side | Location | Mechanism | Trace | Top Edge | Edge Wear | Orientation | Length | Width |

## Table 10: Use-Wear Analysis, Saucers

This table contains all the use-wear data from the imported saucers from Quarter Site B. Vessel indicates the vessel number, artifact is the catalogue number for each sherd, side is the side of the vessels the wear occurs on, location is where on the vessel the wear occurs, mechanism how the wear was produced, trace is the type of wear on the vessel, top edge is the shape of the wears' top edge, edge wear is the amount of abrasive wear on the trace's top edge, orientation is the direction of the wear relative to the vessels, and length and width are the size of the trace, listed in millimeters. For additional explanation, see Chapter 8.

| Vessel | Artifact | Side | Location | Mechanism | Trace | Top Edge | Edge Wear | Orientation | Length | Width |

Table 12: Imported Ceramic Vessels Bought by White Shenandoahans
This table contains all instances of White consumer buying imported ceramics in the merchants' ledgers used for this dissertation (see Chapter 7). Data comes from all ledgers used in this dissertation. "B.C." is Back Creek, "Charles." is Charlestown, "Middle." is Middletown, "Mt. Ol." is Mt. Olive, "Stras." is Strasburg, and "Win." is Winchester.

Table 13: Glass and Tin Cups Bought by White Shenandoahans
This table lists the glass and tin cups bought by White Shenandoahans. Data from all ledger used in this dissertation except the ledger from James Griffith's White Hall store (Griffith 1862). See Chapter 7 for a complete list of ledgers. "B.C." is Back Creek, "Charles." is Charlestown, "Middle." is Middletown, "Mt. Ol." is Mt. Olive, "Stras." is Strasburg, and "Win." is Winchester.

Table 14: Coffee, Drinking Chocolate, and Tea Bought by White Shenandoahans
This table lists purchases of coffee, drinking chocolate, and tea by White Shenandoahans. Data comes from unattributed ledgers from Charles. (Account Book 1 1795), Middle. (Account Book 1806), Stras. (Milton 1849 [no coffee data from 2 January 1847 to 16 January 1849]), and Win. (Account Book 1800; Milton 1849), the Baker Store (1861) Clark Cather’s store (1882), Mahlon Gore's store ( 1860 [data only including 19 February 1859 to 20 February 1860]), the Homer and Nelson Store ( 1851 [coffee data only including 20 September 1849 to 21 September 1850]; 1858 [tea and chocolate only]), and Edward Sperry's store (1839). See Chapter 7 for more information about these ledgers. "B.C." is Back Creek, "Charles." is Charlestown, "Middle." is Middletown, "Mt. Ol." is Mt. Olive, "Stras." is Strasburg, and "Win." is Winchester.

## Appendix G: Supplementary Data for Chapter 9

Table 1: Locally-Made Utilitarian Vessels Bought by White Shenandoahans
This table contains all instances of White consumer buying locally made utilitarian ceramics in the merchants' ledgers used for this dissertation (see Chapter 7). It also contains purchase made at Peter Bell's Hagerstown pottery. While located just north of the Valley, I include the Bell data in this table because Hagerstown has many of the same trends in ceramic production and consumption as the Valley (Comstock 1994b). Data comes from all ledgers used in this dissertation.

Table 2: FTIR Peaks from Locally-Made Ceramics, R001-R003, R024-R044, and R059R065

The table contains the complete FTIR dataset from samples R001-R003, R024-R044, and R059-R065, including both the chipped areas tested for residue and the control samples. Samples R024, R025, and R065 are from locally-made tablewares. Peaks listed as "discard" in the "Discarded?" column were discarded because they belonged to the 31 common peak ranges that are likely due to the extraction solution, the microscope slide, surface contamination, and/or portions of the ceramic body suspended in the extraction solution (also see Table 4). Peaks in this column listed as "residue" did not overlap with peaks from control samples and making them the best candidates to be from absorbed residues. Peaks with nothing in this column are control samples or peaks from chipped areas that matched peaks from the control samples. The "Discarded Range" column lists the commonly occurring peak ranges that were discarded form the analysis. Peak values are in $\mathrm{cm}-1$.

Table 3: FTIR Peaks from Locally-Made Ceramics, R066-R077
The table contains the complete FTIR dataset from samples R066-R077, including both the chipped areas tested for residue and the control samples. Samples R070 and R071 are from locally-made tablewares. This is presented in its own table because these samples (comprised of all samples analyzed during the last two days of testing) seem to lack much of the background interference associated with the extraction solution that can be seen in Table 2. Nothing about the laboratory procedures was altered on those two days, and nor were new bottles of solvents used. After comparing the data, it appears that R066-R077 can be used in conjunction with peaks from the other samples, and this should not affect the results discussed below.

Peaks listed as "discard" in the "Discarded?" column were discarded because they belonged to the 31 common peak ranges that are likely due to the extraction solution, the microscope slide, surface contamination, and/or portions of the ceramic body suspended in the extraction solution (also see Table 4). Peaks in this column listed as "residue" did not overlap with peaks from control samples and making them the best candidates to be from absorbed residues. Peaks with nothing in this column are control samples or peaks from chipped areas that matched peaks from the control samples. The "Discarded Range" column lists the commonly occurring peak ranges that were discarded form the analysis. Peak values are in $\mathrm{cm}-1$.

Table 4: FTIR Data Rejected for Being from Commonly Occurring Peaks
This table contains all 31 commonly-occurring peaks from locally-made ceramics that were removed from the analysis, along with the number of runs that had these peaks. The excluded peaks are presumably from the extraction solution, the microscope slide, surface contamination, and/or portions of the ceramic body suspended in the extraction solution. Group 1 are the samples with "normal" background readings (Table 2) and Group 2 are the samples with little to no background readings from the extraction solution (Table 3). Peak values are in $\mathrm{cm}-1$.

| Discard Peak | Peaks Group 1 | Peaks Group 2 |
| :---: | :---: | :---: |

| 705-696 | 171 | 23 |

Table 5: Comparison FTIR Peaks from Chipped Areas and Control Samples
This table contains all of the peaks left in the dataset after the commonly-occur peaks were excluded, along with the control samples. Peak values are in cm-1. Any peak from Group 1 or 2 that was more than $5 \mathrm{~cm}-1$ from a peak associated with a control sample was considered a residue and analyzed in Chapter 9. Group 1 and Control 1 are the chipped samples and control samples from locally-made samples with "normal" background readings (Table 2), Group 2 and Control 2 are the chipped samples and control samples from local samples with little to no background readings from the extraction solution (Table 3), and Imported Control are the control samples from imported tablewares (see Appendix F).

| Peak | Group 1 | Group 2 | Control 1 | Control 2 | Imported Control |

## Table 6: Use-Wear Analysis, Crocks and Jars

This table contains all the use-wear data from the locally-made crock and/or jars from Quarter Site B. Vessel indicates the vessel number, artifact is the catalogue number for each sherd, side is the side of the vessels the wear occurs on, location is where on the vessel the wear occurs, mechanism how the wear was produced, trace is the type of wear on the vessel, edge is the shape of the wears' top edge, edge wear is the amount of abrasive wear on the trace's top edge, orientation is the direction of the wear relative to the vessels, and length and width are the size of the trace, listed in millimeters. For additional explanation, see Chapter 8.

| Vessel | Artifact | Side | Location | Mechanism | Trace | Edge | Edge Wear | Orientation | Length | Width |

## Table 8: Use-Wear Analysis, Jugs

This table contains all the use-wear data from the locally-made jugs from Quarter Site B. Vessel indicates the vessel number, artifact is the catalogue number for each sherd, side is the side of the vessels the wear occurs on, location is where on the vessel the wear occurs, mechanism how the wear was produced, trace is the type of wear on the vessel, edge is the shape of the wears' top edge, edge wear is the amount of abrasive wear on the trace's top edge, orientation is the direction of the wear relative to the vessels, and length and width are the size of the trace, listed in millimeters. For additional explanation, see Chapter 8.

| Vessel | Artifact | Side | Location | Mechanism | Trace | Edge | Edge Wear | Orientation | Length | Width |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1.157 | 3756.BU | Exterior | Wall | Abrasive | Striation | Linear |  | Diagonal | 6 | 1 |

| 2.024 | 1723.BJ | Interior | Wall | Abrasion | Patch | n/a | Indeterminate | Horizontal |  |  |

## Table 9: Molasses Purchased by White Consumers

This table contains all the transcribed entries for White Shenandoahans purchasing molasses from Valley stores. Data from the Baker Store ledger (1861), Clark Cather's ledger (1882), the Cooper/Davis Ledger (1849, data only covers 27 October 1842 to 31 December 1846), Mahone Gore's ledger (1860, data only covers 19 February 1859 to 20 February 1860), the Homer and Nelson Store (1851, data only covers 20 September 1849 to 9 September 1850), Edward Sperry's ledger (1839), and ledgers from unknown stores in Charlestown, Winchester, and Middletown (Account Book 1 1795; Account Book 1800; 1806). See Chapter 7 for more details on these ledgers.

## Appendix H: Supplementary Data for Chapter 10

Table 1: Evidence for the brick chimney, distribution of crystals, and the chimney fire
This table contains data used to make the map in Chapter 10 (Figure 8) that provides the evidence for the brick chimney, the distribution of crystals, and the chimney fire.

| Unit | Easting | Northing | Bricks (grams) | Mortar (grams) | Stove Part (count) | Crystals, 1 -3cm (count) | Crystals, 46 cm (count) | Burned Soil |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| QB001 | -447.5 | 40.5 | 2.5 | 0 | 0 | 0 | 0 | No |

Table 3: Firing temperature of locally-made earthenware vessels from Quarter Site B
This table presents the firing temperature of 64 locally-made earthenware vessels used in the neutron activation analysis (see Chapter 7 and Appendix E). Firing temperatures determined by heating samples from each vessel up to $900^{\circ} \mathrm{C}, 950^{\circ} \mathrm{C}, 1,000^{\circ} \mathrm{C}$, and $1,050^{\circ} \mathrm{C}$ in a test kiln and letting them soak at that temperature for 30 minutes before reducing the temperature. After each run, the color of the sample was compared against the sherd it came from using a Munsell book, and the temperature at which a color change was first noted was determined to be the firing temperature.

| Sample | Vessel | Firing Temperature |
| :---: | :---: | :---: |
| SYU006 | 5.010 | $950^{\circ} \mathrm{C}$ |
| SYU007 | 5.011 | $950^{\circ} \mathrm{C}$ |
| SYU013 | 4.007 | $950^{\circ} \mathrm{C}$ |
| SYU014 | 4.010 | $>1,050^{\circ} \mathrm{C}$ |
| SYU016 | 4.001 | $1,000^{\circ} \mathrm{C}$ |
| SYU017 | 4.012 | $1,000^{\circ} \mathrm{C}$ |
| SYU050 | 1.083 | $950^{\circ} \mathrm{C}$ |
| SYU051 | 1.085 | $1,000^{\circ} \mathrm{C}$ |
| SYU052 | 1.087 | $1,000^{\circ} \mathrm{C}$ |

# Curriculum Vitae <br> Matthew C. Greer <br> 2022 

## EDUCATION

Ph.D. Anthropology, Syracuse University, August 2022
M.A. Anthropology, University of Southern Mississippi, December 2014
B.A. History, University of Mary Washington, May 2009

## RESEARCH INTERESTS

Historical Archaeology
African Diaspora Archaeology
Archaeological Theory
Black Studies
Materiality / New Materialism
Race / Racialization

Ceramic Analysis
Archaeometry
Field Methods
Documentary Research
Landscape Studies
Food Studies

## ACADEMIC APPOINTMENTS

2022-Present Post-Doctoral Fellow, Archaeometry Laboratory, University of Missouri Research Reactor
2020-2022 Pre-Doctoral Fellow. Carter G. Woodson Institute for African-American and African Studies, University of Virginia

## PUBLICATIONS

## Referred Journal Articles

2022 Buying Local: A Multi-Method Approach to Determining the Provenance of LocallyMade Lead-Glazed Earthenwares. Archaeological and Anthropological Sciences. 14(7):1-15. (Matthew C. Greer and Brandi L. MacDonald)

2010 Archaeological Investigation of The Rackliffe House and Grounds, Site 18WO230, On the Approximately Three Acre Property of the Rackliffe House Trust, in the Vicinity of the Assateague National Seashore and Assateague Island State Park, Wocester County, Maryland. Rackliffe House Trust. (Aaron Levinthal, Ryun Papson, and Matthew Greer)

## AWARDS AND HONORS

2015 University of Southern Mississippi Nominee, Social Science Division, Conference of Southern Graduate Schools Master's Thesis Award 2016
2014 University of Southern Mississippi Graduate Student Research Symposium, Department Award Winner, Department of Anthropology and Sociology

2014 Irmgard H. Wolfe Award for Best Graduate Paper in Anthropology, Department of Anthropology and Sociology, University of Southern Mississippi
2013 William F. Coker Award for Best Graduate Student Paper, Gulf South History and Humanities Conference

## GRANTS AND FELLOWSHIPS

2022

SBE Postdoctoral Research Fellowship, National Science Foundation, award 2204085 (\$143,00)
2021 Roscoe Martin Graduate Award, Syracuse University $(\$ 1,200)$
2020 2020-2022 Pre-Doctoral Fellow, Carter G. Woodson Institute for African-American and African Studies, University of Virginia $(\$ 48,000)$
2020 Grants-in-Aid of Research, Sigma Xi, grant G2019100194732789 (\$1,000)
2020 Roscoe Martin Graduate Award, Syracuse University $(\$ 1,200)$
2019 Pre-Doctoral Internship, University of Missouri Research Reactor Archaeometry Laboratory $(\$ 14,400)$
2018 Roscoe Martin Graduate Award, Syracuse University (\$750)
2017 Maxwell Dean's Summer Fellowship, Syracuse University $(\$ 4,820)$
2017 Roscoe Martin Graduate Award, Syracuse University (\$730)
2016 Maxwell Dean's Summer Fellowship, Syracuse University (\$4,020)
2015 2015-2016 External Fellowship, Department of African American Studies, Syracuse University $(\$ 23,830)$

## INVITED TALKS AND PANELS

2022 How Did They Use That Saucer?: Archaeological Science, Historic Documents, and Assumptions About Enslaved People's Use of Tea Wares. DAACS Conversation Series (25 February)
2021 Cities, Towns, and Country Stores: Enslaved Consumers and the Politics of Shopping in the Shenandoah Valley. President's Career Enrichment Program, Lord Fairfax Community College ( 17 November)
2021 Panelist - A Grinding Curse: Race and Slavery in the Shenandoah Valley. George Tyler Moore Center for the Study of the Civil War, Shepherd University (19 May)
2021 Archaeological Excavations at Belle Grove Plantation. Lunch and Learn, Montpelier Archaeology Department (10 March)
2020 Panelist - African American Archaeology and Landscapes. Petersburg National Battlefield (25 October)
2019 Cather and Enslaved Life in the Northern Shenandoah Valley. Plenary Session, International Willa Cather Seminar (17 June)
2018 Slavery and Ceramics at Belle Grove Plantation: Archaeological Research of the Enslaved. Human Services Student Organization / Diversity and Inclusion Council, Lord Fairfax Community College (8 November)

2018 Buying Crocks and Making History: Enslaved Consumers and the Development of the Shenandoah Valley. Plenary Session, Public Education Forum, Council of Virginia Archaeologists (12 October)
2018 The Archaeology of Enslaved Life in the Shenandoah Valley. Department of Art History and Archaeology, Hood College (2 April)

## CONFERENCE ACTIVITY

## Conference Symposia Organized

2022 Belle Grove Plantation: Researching Plantation Life in the Shenandoah Valley. Middle Atlantic Archaeology Conference (Matthew C. Greer and Erica G. Moses)
2020 Plantation Archaeology as Slow Archeology. Annual Conference on Historical and Underwater Archaeology
2019 Plantation Archaeology as Slow Archeology. Theoretical Archaeology Group, North America (Theresa Singleton and Matthew C. Greer)
2018 Archaeologies of Free and Enslaved Communities in the Shenandoah Valley. Middle Atlantic Archaeology Conference

## Conference Papers and Panels

Forth. That Sherd with the Fingerprints: Altering Public Perceptions of Ceramics and Slavery in Virginia's Shenandoah Valley. Annual Conference on Historical and Underwater Archaeology
2022 What Town Did They Buy That From? Mapping Enslaved People's Consumption Practices in Virginia's Shenandoah Valley. Middle Atlantic Archaeology Conference
2021 Panelist - Uncovering Best Practices in Archaeological Collections. Association for Living History, Farm and Agricultural Museums Annual Conference
2021 Hunger: The Ontological Politics of Food in the Plantation South. Theoretical Archaeology Group, North America
2021 Cobalt, Lead, and Borax: Preliminary Elemental Analysis of Late-18 ${ }^{\text {th }}$ to Mid-19 ${ }^{\text {th }}$ Century British Refined Earthenware Glazes. Middle Atlantic Archaeology Conference. (Matthew C. Greer and Brandi L. MacDonald)
2021 Racializing Surveillance and the (Re)Production of Blackness in Plantation Landscapes. Annual Conference on Historical and Underwater Archaeology
2020 Making Time for Tea(wares): Slow Archaeology, Enslaved Life, and the Poetics of Consumption. Annual Conference on Historical and Underwater Archaeology
2019 Making Time for Tea(wares): Slavery, Economies, and the Poetics of Consumption. Theoretical Archaeology Group, North America
2019 Crocks, Cabins, and Slavery: The Intermingling of African and German Diasporas in Virginia's Shenandoah Valley. Middle Atlantic Archaeology Conference
2019 Making Food, Making Middens, and Making Communities: Exploring the Effects of Cooking and Trash Disposal on a Virginia Plantation. Annual Conference on Historical and Underwater Archaeology (Matthew C. Greer and Scott Oliver)
2018 Black Virginians and Locally Made Ceramics in the Shenandoah Valley. Annual Meeting of the Society for American Archaeology

2018 Global Commodities and Internal Economies: Enslaved Consumers in the Northern Shenandoah Valley. Middle Atlantic Archaeology Conference
2018 Poaching Pots and Making Places: Slavery and Ceramic Consumption in the Shenandoah Valley. Annual Conference on Historical and Underwater Archaeology
2018 Can You See Me Now?: Exploring Lines Of Sight On A Virginia Plantation. Annual Conference on Historical and Underwater Archaeology (Erica G. Moses and Matthew C. Greer)
2017 Panopticism and the Practical Politics of Slavery in the Shenandoah Valley. Middle Atlantic Archaeology Conference
2017 Starting Over After Being Taken Away: Enslaved Women, Forced Relocation, and Sexual Relationships in Antebellum Virginia. Annual Conference on Historical and Underwater Archaeology
2016 Transfer-Prints, Gilded Buttons, and Social Relationships: Costly Consumer Goods and Social Interactions within an Enslaved Community. Middle Atlantic Archaeology Conference
2016 Many Remedies to Choose From: Social Relationships and Healing in an Enslaved Community. Annual Conference on Historical and Underwater Archaeology
2015 Interactions Across the Landscape: Interpreting Social Relationships within Montpelier's Black Community. Annual Conference on Historical and Underwater Archaeology
2014 Kin or Coins: Assessing Enslaved Social Relations in the Virginia Piedmont. University of Southern Mississippi Graduate Student Research Symposium
2014 Freedom in the Flesh: Assessing the Effect of Freedom on African American Health in Natchez, Mississippi. Annual Meeting of the Mississippi Archaeological Association
2013 Bundles, Passes, and Stolen Watches: Interpreting the Role of Material Culture in Escape. Gulf South History and Humanities Conference
2013 Nipping at the Heels of Slavery: Identifying Enslaved Resistance Through Contextualizing the "Dog Burial" at James Madison's Montpelier. University of Southern Mississippi Graduate Student Research Symposium
2013 Social Status and Inter-Household Interactions Amongst a $19^{\text {th }}$ Century Enslaved Community. Annual Conference on Historical and Underwater Archaeology
2012 Bondsman's Best Friend? - Analyzing the Cultural Significance of the "Dog Burial" at James Madison's Montpelier. Annual Meeting of the Southern Archaeological Conference
2012 Inter-Quarter Community Relations at James Madison's Montpelier. Middle Atlantic Archaeology Conference
2012 The South Kitchen Revisited: Using Ceramic Crossmend Data to Reinterpret Stratigraphy. Annual Conference on Historical and Underwater Archaeology

## CAMPUS AND DEPARTMENTAL TALKS

2021 Cities, Towns, and Country Stores: Enslaved Consumers and the Politics of Shopping in the Shenandoah Valley. Archaeology Brown Bag Workshop, University of Virginia (12 November)
2018 Panelist - Teaching Power: Dealing with Power Dynamics in the Classroom. TA Program Workshop, Syracuse University (9 February)

## TEACHING EXPERIENCE

## Hood College

- Archaeological Field School, Director (Summer 2018, Summer 2019)

## Syracuse University

- Global Encounters, Teaching Assistant (Fall 2018)
- Introduction to Archaeology and World Prehistory, Teaching Assistant (Fall 2016)
- Introduction to Historical Archaeology, Teaching Assistant (Spring 2017, Spring 2018, Spring 2019)
- Peoples and Cultures of the World, Teaching Assistant (Fall 2017)

## University of Southern Mississippi

- The Human Experience, Instructor of Record (Spring 2014)
- The Human Experience, Teaching Assistant (Fall 2012, Spring 2013)
- Introduction to Cultural and Linguistic Anthropology, Teaching Assistant (Fall 2013)

## ARCHAEOLOGICAL EXPERIENCE

2015-Present Belle Grove Quarters Project, Project Director<br>2019-2020 Pre-Doctoral Intern, University of Missouri Research Reactor<br>2018-2020 Syracuse University, Research Assistant<br>2014-2015 The Montpelier Foundation, Crew Chief<br>2014-2015 Syracuse University, Field Technician<br>2014 University of South Alabama Center for Archaeological Studies, Field Technician<br>2013 Panamerican Consultants, Inc., Field Technician<br>2013-2014 University of Southern Mississippi, Laboratory Manager<br>2011-2012 The Montpelier Foundation, Crew Chief<br>2010-2011 Advantage Environmental Consultants, Crew Chief / Lab Manager<br>2009-2011 Louis Berger Group, Field Technician<br>2009 Cultural Site Resource Management, Field Technician<br>2008 University of Mary Washington Center for Historic Preservation, Field School Participant and Field Technician

## SERVICE

## Professional Service

2021-Present Member, Public Education Committee, Council of Virginia Archaeologists
2018-2019 Co-Chair, Organizing Committee, Theoretical Archaeology Group North America 2019 Meeting

## Thesis Committees

2020-Present Outside Reader, Linda Seminario, "Provisioned, Produced, Procured," and Purchased?: A Study of Enslaved African Economic Involvement in the Shenandoah Valley. University of Massachusetts, Boston

## Campus Service

2016-2017 Treasurer, Anthropology Graduate Student Organization, Syracuse University 2013-2014 Treasurer, Anthropology Society, University of Southern Mississippi

## PUBLIC OUTREACH

## Committees and Boards

2022-Present Member, Board of Directors, Belle Grove Plantation
2020-Present Member, Education Committee, Belle Grove Plantation
2020-Present Consulting Archaeologist, Belle Grove Virtual Project

## Museum Exhibits Curated

2022 Unearthing Enslaved Lives at Belle Grove. Permanent exhibit at Belle Grove Plantation, Middletown, Virginia. (Matthew C. Greer and Kristen Laise)

## Public Lectures

Forth. Social Histories of Tea, Coffee, and Drinking Chocolate in the Shenandoah Valley. Belle Grove Plantation. (18 September)
2022 Archaeology at Belle Grove Plantation. The Historic Strasburg ParaVation. (21 May)
2021 How Remote Sensing Helps Public Archaeology. Belle Grove Plantation (11 August)
2021 Enslaved Foodways in the Valley. Shenandoah Valley Black Heritage Center (22 June) (Kate Bajorek, Matthew Greer, Scott Oliver, Linda Seminario)
2021 Putting Together the Pieces: How Small Ceramic Fragments Reveal Much about the Life of the Enslaved at Belle Grove. Belle Grove Plantation (9 February)
2020 Updates on the Scientific Analysis in the Archaeological Research at the Belle Grove Enslaved Quarter Site. Belle Grove Plantation (25 June)
2019 Enslaved Shenandoahans and Locally-Made Ceramics. Inalienable Rights: Free and Enslaved Blacks Crafting a Life in the Shenandoah Valley, Belle Grove Plantation (9 November)
2019 Digging Up Soul Food: Choice, Survival, and Food in the Shenandoah Valley. Honoring Shenandoah Valley's Soul Food History and Chefs (3 August) (Matthew Greer and Scott Oliver)
2019 Archaeology at Belle Grove Plantation. Educational Workshop Series, Shenandoah County Parks and Recreation (27 June)
2018 Archaeological Investigation of the Slave Quarter Site at Belle Grove. Inalienable Rights: Free and Enslaved Blacks Crafting a Life in the Shenandoah Valley, Belle Grove Plantation (10 November)
2017 Archaeology at Belle Grove. Front Royal Rockhounds Association (22 July)

## Media Coverage

2022 Belle Grove Plantation Open for 2022 - New Exhibit ‘Unearthing Enslaved Lives at Belle Grove' Now on View. Royal Examiner (23 March)
2019 Belle Grove Begins 2019 Archaeological Season. The Northern Virginia Daily (16 June)
2019 Archaeologists Return to Belle Grove Plantation for Final Season. WVDM (14 June)
2018 Details unearthed of lives in bondage at Belle Grove. The Winchester Star (7 August)
2018 Archaeologists Continue to Dig Up History at Belle Grove Plantation. WVDM (7 June)
2018 Belle Grove Continues Archaeological Investigations at Slave Quarter Sites. The Northern Virginia Daily (6 June)
2017 Untold history of slaves unearthed at Belle Grove Plantation. The Winchester Star (3 July)
2017 Slaves at Belle Grove: Archaeologists Offer Talks on Their Discoveries. The Northern Virginia Daily (28 June)

[^0]:    ${ }^{1}$ By comparison, exports from Baltimore accounted for $20-27 \%$ of the United State's exports in the mind-1820s (Niles' Weekly Register 1827).

[^1]:    ${ }^{2}$ No monolithic $18^{\text {th }}$-century German ethnicity existed, so we must avoid collapsing the many ways of being German into a single German identity (e.g., Fennell 2017, 119; Wust 1969, 186-88). Still, shared memories, practices, and diasporic experiences existed, allowing us to use "German" as a label for the multiplicity of identities that originated in what is now Germany (Fennell 2007; 2017; Garver 2015).

[^2]:    ${ }^{3}$ This only includes the 44 Valley-specific works that do not primarily discuss Virginia Indians in the region.

[^3]:    ${ }^{4}$ Here I cite the 1850 Expanded and Revised edition of Kercheval's A History of the Shenandoah Valley instead of the first edition, as it is the more commonly read and cited version. However, one can find these same trends the first edition. Perhaps the largest difference between the first edition and the expanded edition is that the earlier version contained an appendix entitled "Notes on the Settlement and Indian Wars of the Western Parts of Virginia and Pennsylvania" by Joseph Doddridge. This appendix contained a chapter on the "cruelties of slavery" (Kercheval 1833, 386-93). This caused "the Slave-Holding Valley" to boycott the book until Kercheval removed Doddridge's appendix in the 1850 Expanded edition (J. E. Taylor 1989, 113-14). Some argue Kercheval was attempting to "thrust his lance into" the institution of slavery by including Doddridge's comments (J. E. Taylor 1989, 114). But we should note that Doddridge's only mentioned eastern Maryland, discursively placing the "cruelties of slavery" outside of the Shenandoah Valley and creating the false impression that if slavery existed in the Valley it was (more) benign.

[^4]:    ${ }^{5}$ In these cases, Kercheval frequently uses racist tropes to discuss Black people. For instance, when describing one raid, he argues that an enslaved woman "killed her own child for fear it should fall into the hands of the Indians, or hinder her from making her escape" (1850, 174, my emphasis), rendering her an unfit mother - a stereotype many have used to demonize Black women (Collins 2000). He contrasts this with the woman's enslaver, who was captured in the raid, bravely attempted to kill her captors, and eventually escaped.

[^5]:    ${ }^{6}$ The 1830 figures come from the Western District of Frederick County, all of which remained in Frederick County after Clarke County was formed from eastern Frederick County in 1836.
    ${ }^{7}$ The exception to this is Susanne Simmons (1994, 55; also see Simmons and Sorrells 2000), who argues, without evidence, that the "military-style discipline that characterized plantation societies" did not exist in the region.

[^6]:    ${ }^{8}$ Denkler's recent study of slavery in the Valley (2020) places more of a focus on enslaved people than earlier works, but the main focus of her work is how slavery has been erased from Valley histories - a topic which lead the bulk of her analysis to focus on White Shenandoahans (especially historians) instead of the live of enslaved women, children, and men.

[^7]:    ${ }^{9}$ I follow Yannis Hamilakis (2017) and Helen Briassoulis $(2017,214)$ in referring to this literature as assemblage thinking instead of assemblage theory, which avoids equating the various interpretations of Deleuze and Guattari with the work of Manuel DeLanda (e.g., 2016), who refers to his work with assemblages as assemblage theory, while also emphasizing that this provides an open-ended way of thinking instead of a single, unified theory (contra Nail 2017).

[^8]:    ${ }^{10}$ I follow Chris Fowler (2013), Hamilakis (2013; 2017), and Oliver Harris (2014; 2017) in seeing assembles as composed of corporeal (e.g., physical things) and non-corporeal entities (e.g. discourses, world views).

[^9]:    ${ }^{11}$ Deleuze and Guattari (1994) and Elizabet Grosz (2008) also use the term composition in their works, but they reserve the term for discussions of art. However, here I draw inspiration from Monica Allewaert's (2013) use of (de)composition to talk about a variety assemblages.
    12 This focus on heterogeneity maps onto discussions of pluralistic contexts - "spaces, sites, and settlements created and inhabited by the diverse people brought together by structural forces of the modern world" (Phillippi 2018, 6) that have increasingly gained favor in archology since the 1990s (e.g., Agbe-Davies 2018; Lightfoot 1995; Lightfoot et al. 1998; Matthews and McGovern 2018; Hutchins-Keim 2018). However, defining some contexts as plural creates a binary in which others must be defined as singular/homogenous; otherwise all contexts would be plural, and the term has no meaning. Yet, when we consider the various types of people, materials, discourses, and institutions that proliferate in all the places we study we cannot say that places are ever homogenous. This makes assemblage thinking a better theoretical starting point for the study of heterogeneity.

[^10]:    ${ }^{13}$ Deleuze and Guattari and others argue here that these effects also allow one assemblage to impact another. However, for Assemblage 1 (for lack of a better name) to impact Assemblage 2 these would need to be fitted together in another, larger assemblage (say Assemblage 3), and therefore these affects would be better described as the impact of one part of Assemblage 3 acting on another part of Assemblages 3.

[^11]:    ${ }^{14}$ This heterarchical point is critical assemblage thinking's political dimensions, where Deleuze and Guattari's concepts of state logic, striated spaces, arborescences are used to describe the ways contingent hierarchies emerge from (as they put it) nomadic, smooth, and/or rhizomatic collectives, and how these orderings may decompose, melting back into the unordered spaces from whence they came. This ability to explore hierarchies makes assemblage thinking more useful than the Deleuze-inspired work of Tim Ingold (e.g., 2011) - who eschews hierarchal orderings instead of critically engaging with them - when exploring situations where the emergence of rankings come to have a very real effects on the people we study, such as the violent hierarchies that enslaved Black people in the Shenandoah Valley. Furthermore, as Glissant (1997, 11-12) argues, the complete rejection of hierarchies (as we see with Ingold) creates an ontological hierarchy its own, wherein the hierarchal orders are seen to be lesser than unstructured collectives, a view which "reverts to the ideological claims presumably challenged by this thought." In many ways this issue maps onto critiques by scholars of color against the "complete disavowal of subjectivity" in most of assemblage thinking (e.g., Glissant 1997; T. L. King 2017; Spivak 1988; Weheliye 2014, 48).

[^12]:    ${ }^{15}$ In the original quote, Deleuze and Guattari state that we know nothing about "a body" until we know what it can do. I follow Ian Buchannan (1997, 74) in seeing Deleuze and Guattari's use of the term body in this context as another way of saying assemblage.

[^13]:    ${ }^{16}$ Glissant (e.g., 1997, 190-93) describes this as granting a "right to opacity" to those we study. In many ways we can see this as a way of granting the ethnographic right of refusal (e.g., Shange 2019a; Simpson 2014) to people who

[^14]:    cannot chose if they want us to dissect their lives to explore the meanings behind their actions, or who, even in life, might not have been able to legally consent to this (also see Liebmann 2012, 8; Reilly 2019, 39).
    ${ }^{17}$ While Tsing explicitly states that the elements she is interested in studying with friction are universalizing notions (e.g., capitalism) and local conditions (e.g., Indonesian forests and the people who interact with them), her work can be expanded to include the diverse materialities, practice, and institutions that come together in acts of assemblage. ${ }^{18}$ Oftentimes scholars refer to the movement of things into and out of assemblages as "flow" (e.g., Cipolla 2018; DeLanda 1997; Deleuze and Guattari 1987). Yet, as Rockefeller (2011) argues, this creates a managerial view of these movements that elides the complex and oftentimes violent actions that propel flows (also see Tsing 2005, 5). Therefore, adding Tsing's concept of friction into assemblage thinking helps to avoid this by refocusing out on the sociomaterial processes that allow things to move through assemblages (also see Pezzarossi 2020).

[^15]:    ${ }^{19}$ The average lifespan of farmers was 57 years $(\mathrm{n}=136)$, while enslaved men $(\mathrm{n}=82)$ and white laborers ( $\mathrm{n}=42$ ) lived on average 41 years. Data is from Frederick, Warren, and Shenandoah County.

[^16]:    ${ }^{20}$ Here, assemblage thinking, especially its early development in Deleuze's Difference and Repetition (1994), provides some benefits over practice theory, especially Bourdieu's concepts of habitus and doxa (e.g., 1977), which also emphasize repetitions (as these structures exist in and through their continual enactment) but do so by focusing on what stays the same in these iterations, while downplaying (and often ignoring) the equally important question of what changes every time these practices are enacted. By allowing differences to become as important as continuities in these cases, however, we gain the ability to see how they can change over time, and how the introduction of new materialities into habitual practices alters the assemblages.
    ${ }^{21}$ DeLanda refers to these as "closed" and "open" assemblages. However, I use the terms tighter and looser to avoid the binary thinking creating by open/closed, and because these terms are more applicable to the action they are describing - the degree to which components are held in place (e.g., Glissant 1997, 65-66). Furthermore, DeLanda uses these to discuss how certain assemblages extend across time and space, and not specifically to talk about the

[^17]:    ways different assemblages repeat, creating similar effects across time and space. Here, I draw inspiration from Benítez-Rojo's (1996) work on the repetition of assemblages to reframe DeLanda's work along these lines as this focus on repetition and effects is more in keeping with my focus on poetics.

[^18]:    ${ }^{22}$ I might go so far as to say that to responsibly think with assemblages one must engage with how scholars of color take up and/or critically respond to these theories (e.g., Benítez-Rojo 1996; Byrd 2011; Glissant 1997; T. L. King 2017; Puar 2017; Weheliye 2014; Yountae 2014), as failing to do reproduces the universality of liberal humanism (where economically privileged white Men stands as the model of humanity, see Chapter 3) that (inadvertently) animates mainstream posthumanism/new materialism (e.g., Z. I. Jackson 2013; 2016; 2020; López 2018).
    ${ }^{23}$ In this paragraph I read the works of assemblages thinkers through Judith Butler's (e.g., 1993; 1999) discussion of the ways gender identities become performatively reiterated across time and space, and Karen Barad's (2007) new materialist reinterpretation of the ontological implications of Butler's work.
    ${ }^{24}$ Here I rework Lucas's (2012) use of citationality as a way to describe the typographic similarities in the way elements are arrange within assemblages (also see A. M. Jones 2007; Pauketat 2013), to describe effects. However, doing so is in keeping with Butler, as she states $(1993,13)$ that "the norm of sex" which would be an effect of the

[^19]:    way various components act upon each other, "takes hold to the extent that it is 'cited' as such a norm, but it also derive its power from the citations it compels," or from the ways people are compelled to reiterate these effects in and through their own actions.
    ${ }^{25}$ This dynamic ability to explore change makes assemblage thinking more beneficial to this study than actor network theory (e.g., Latour 2005) or Ian Hodder's (2012) entanglement, as these other schools of thought focus intently on the ways networks of things act together, but in doing so they have a difficultly exploring how these networks change over time (Ingold 2011, 89-94). For instance, while actor network theorists focus on how things get "translated" between networks - a focus which we may see as akin to how assemblages changing in their various iterations - this proposes a stability onto the thing in question both before and after its translation. Doing so undermines the view that assemblages are constantly changing.

[^20]:    ${ }^{26}$ While I find Agamben's broader definition of apparatuses to be helpful, he (2009, 13-14, my emphasis) specifically argues that apparatuses act upon the "gestures, behaviors, opinions. or discourses of living Beings," which he sees as ontologically distinct from both apparatuses and from the inorganic world around them (which does not play a role in his apparatuses). Therefore, in keeping with the flat ontologies advocated by assemblages thinking, I have slightly rephrased Agamben's work.

[^21]:    ${ }^{27}$ Judith Butler (1993) and Michel de Certeau (1984) also reformulate Foucauldian apparatuses to theorize how they can be dismantled. For Butler, the fact that apparatuses only exist while they are being enacted provides ways for subversive performances of gender identities that call into question the heteronormativity. De Certeau focuses on how apparatuses' components can be poached and brought into new relationships that allow people to make do within the spaces occupied by political structures. However, assemblages thinking allows the possibility for us to use either (or both) these theories, while also providing a more nuanced way to theorize the sociomaterial components that create hegemonies then Butler provides, and a recognition that acts of poaching reshape political structures, which de Certeau does not address.

[^22]:    ${ }^{28}$ Judith Butler (1993) adds gendered dimensions to this, she does not question liberal humanism's equation of the human with economically privilege white people. While Michel de Certeau (1984) also theorizes the human in ways consistent with other practice theorists (A. T. Smith 2003, 70), I do not include him in this discussion because his work is uninterested in how the tactics people use to make lives for themselves affect the political structures around them.

[^23]:    ${ }^{29}$ While others have called this tradition "Black feminist theories of the human" (Weheliye 2014) or "Black feminist new materialism" (Towns 2018), Britany Cooper (2015) argues against this as it reorients the definition of Black feminism toward the work of Sylvia Wynter, Hortense Spillers, and Saidiya Hartman, and away from the majority of women working within Black feminism. Therefore, I use Zimitiri Erasmus's (2020) and Katherine McKittrick's (Wynter and McKittrick 2015) term "counter-humanism" as it avoids this controversy while more accurately describing the work this body of literature seeks to accomplish.

[^24]:    ${ }^{30}$ Wynter's hybrids are different than those discussed by Bruno Latour (1993), who sees hybrids as mixtures of "culture" and "nature."

[^25]:    ${ }^{31}$ Chen focuses on how animacies equate queer and/or racialized people with animals. However, Jackson argues that the human/animal divide is itself a racialized distinction that emerged from the bestialization of Black humanity. Therefore, while Chen's views on animacies can be projected backwards in time, we must take not to assume $a$ priori that an ontological category of "the animal" was understood as being oppositional to "the human."

[^26]:    ${ }^{32}$ Wynter places this switch in various points in time throughout her writings. While this universality began with Man1 (Wynter 2003, 299) it became a critical component of racializing assemblages with the $19^{\text {th }}$-century emergence of Man2 (Wynter and McKittrick 2015, 46-47) when humanist discourses stopped casting Black people as inherently differently (see below) and started discussing Black people's abject status as a personal failing.

[^27]:    ${ }^{33}$ While this uses some of the same language as the new materialism's discussions of positive, transcendent becomings (e.g., Deleuze and Guattari 1987; Haraway 2016; Ingold 2011), the process of becoming-fungible was nauseating brutal (e.g., Browne 2015; Fanon 1967; Musser 2012; Spillers 1987). This highlights the fact that the new materialism's discourse on becomings is itself racialized, emerging from, and largely speaking to, the experiences and possibilities of whiteness (e.g., Benjamin 2018a; Byrd 2011; T. L. King 2017; Yountae 2014).

[^28]:    ${ }^{34}$ Alexander McKay notes that he was paid $£ 4.15$ to castrate Joe but does not state why. However, a 1792 law declared that castration was only legal if an enslaved man "attempted to ravish a white woman" (Guild 1969, 160).

[^29]:    ${ }^{35}$ The article does not mention where these Indigenous people were being enslaved.

[^30]:    ${ }^{36}$ The recycled discourses about the subjugation of enslaved people as an element of divine order come to us primarily through the narratives of formerly enslaved people instead of newspaper articles, which provided the other sources cited in their paragraph. This suggests that while we see older arguments were called forth to justify slavery, these discourses were enacted in conversations between enslavers and the enslaved, while more secular discussions of intelligence, morality, or biology occurred between enslavers.

[^31]:    ${ }^{37}$ Harpers Ferry is located on the northern edge of the Shenandoah Valley, and has seen extensive archaeological investigations since the 1980s, but most Valley historians do not include the city in their discussion. As such, I do not include this literature on the city in this chapter.

[^32]:    ${ }^{38}$ Virginia Indians is the preferred nomenclature of Native American groups in the state.

[^33]:    ${ }^{39}$ The term quarter can refer to a parcel of land within a plantation, the place where enslaved people lived, and the induvial houses in these living spaces. Following Barbara Heath and Eleanor Breen (2009), I use quarter/quartering site to refer to enslaved people living spaces, house/home/cabin to refer to the dwellings in these spaces, and estate/tract/plantation to refer to the Hites four properties.

[^34]:    ${ }^{40}$ These were both initially identified as quarters, but research described below indicated the 44FK521 is an agricultural complex.

[^35]:    ${ }^{41}$ These excavations began while the initial assessments of other portions of the site and the adjacent agricultural complex were still ongoing.

[^36]:    ${ }^{42}$ One August Isaac Hite, Jr. (1805) stated that in "May we had a good rain and another... in June... [but] since which we have not had one to wet the ground more than half an inch in ploughed ground."

[^37]:    ${ }^{43}$ Here I am separating agricultural labor (working in the fields) from gardening. White women frequently gardened, with their work helping to feed their families. But historical sources show that this was considered an extension of domestic work, unlike agricultural labor which was considered to be distinct from domestic work.

[^38]:    ${ }^{44}$ Men listed as farmers lived longer, on average, than other white men ( 57.02 years versus 44.26 years). This suggests that the percentage of farmers in the registers might underrepresent the number of farmers in the general population. However, not all men listed as farmers actually did field work, as several men known to have enslaved multiple enslaved people are listed as farmers, as are 15 men over 80 , including a 108 -year-old man. It is questionable that they did fieldwork in 1850. Therefore, I would argue that these two considerations cancel each other out, allowing us to use the death registry numbers. A detailed comparison of the "number of people engaged in agriculture" column of the Federal Censuses could clarify this and provide data for earlier decades. This column also seems to provide the total number of white, Free Black, and enslaved male farmers per household, so it would let us start gathering data on enslaved farmers. However, this column does not specify how many of the farmers are white, Free Black, or enslaved. Determining how many of the farmers are white or enslaved would require extensive research and is beyond the scope of this dissertation, especially since this would not provide any meaningful data on enslaved women or men who were not regularly employed in agriculture by whom worked in the field when needed.

[^39]:    ${ }^{45}$ While selling unprocessed wheat was also a possibility, records show that Alexandria merchants primarily dealt in flour, so Valley farmers seem to have mostly shipped milled grains eastward (e.g., Galpin 1927).
    ${ }^{46}$ Presumably, merchants sold whole grains to millers so it could be ground down to flour/cornmeal, but no records of this have been found.

[^40]:    ${ }^{47}$ The available records do not include enslaved women or children.

[^41]:    ${ }^{48}$ Comparing the 1810 and 1820 Censuses and relevant tax documents can provide information on this. Censuses list who owned enslaved people while the tax records show who paid taxes on them because hires usually paid taxes on the people they hired. Anyone who paid taxes on enslaved people but who is not listed as an enslaver in the census should be hiring enslaved people. However, this research is beyond the scope of this dissertation.

[^42]:    ${ }^{49}$ All flour prices are converted to the value of the US Dollar in 1810, allowing them to be directly compared. Prices for Georgetown were not collected.

[^43]:    ${ }^{50}$ As of 12 February 2021, only three articles in Historical Archaeology, International Journal of Historical Archaeology and Journal of African Diaspora Archaeology and Heritage use "hunger" or "hungry" to talk about enslaved people's lack of food. Sara Cofield (2006) discusses hungry enslaved people stealing corn, but Jean Howson (1990) only brings up hunger in an abstract discussion of slavery and Michael Gall et al. (2020) only mention tobacco's ability to dull hunger pangs. "Faunal" and "plantation" cooccur in 251 articles, so this trend is not due to a lack of articles on enslaved diets. Keyword searches performed on using the search function on each journals' webpage.

[^44]:    ${ }^{51}$ By the 1840 s and 1850 s cornmeal rations seem to have increased to a peck and a half per week throughout the South (e.g., Covey and Eisnach 2009; S. B. Hilliard 1972; Kiple and King 1981; McKee 1999; Stampp 1989; Sutch 1975; Twitty 2017).
    ${ }^{52}$ These periodicals include American Farmer, American Farmer, and Spirit of the Agricultural Journals of the Day, Farmer's Register, and Southern Planter. Each was published in Virginia/Maryland and have articles by Shenandoahans and/or about Valley farms/plantations.

[^45]:    ${ }^{53}$ Most formerly enslaved people would agree with this (e.g., Covey and Eisnach 2009; Douglass 1855; Northup 1853). However, Herbert Covey and Dwight Eisnach (2009) note that some narratives state that enslaved people were given enough food, although these were likely cases where enslavers issued additional rations.
    ${ }^{54}$ Assuming 2.5 hours of down time for meals when there was less work December and only 1.5 hours in June when there was more work to be done. Hours of daylight obtained from https://www.timeanddate.com/sun/@5051468 (accessed 5 December 2020).
    ${ }^{55}$ Height, age, gender, and temperature are also important factors, but I focuses on weight because I cannot find any discussion of farmers' caloric expenditures that include these other factors.

[^46]:    ${ }^{56}$ Here I modified Richard Sutch's (1975) clinometric study of enslaved diets to reflect the work enslaved Shenandoahans did, the length of their workdays throughout the year, and Jerry, Ned, Primus, Salley, and Truelove's hypothetical weight. Almost all the tasks enslaved farmers did throughout the year (clearing and preparing fields, harvesting, hauling, mowing, planting, plowing) are classified as "moderate" in terms of their energy expenditure (5.0-7.4 Kcal per minute for a 65 kg person) (Durin and Passmore 1967; F. B. Jones 1860; Sutch 1975, 385-86). Only in December did enslaved farmers commonly do tasks that required significantly greater or lesser amounts of energy (cutting wood [7.5-9.9 Kcal per minute], and shucking corn [2.0-4.9 Kcal per minute], respectively). To estimate Jerry's work-related energy expenditure I multiplied the mean energy expenditure for moderate activity ( 6.2 Kcal per minute) for a 65 kg person by the mean length of the workday, estimated to be 2.25 hours (average length of breakfast and dinner (Pauling 1836, 181)) less than the amount of average daylight per month. I then adjusted the energy expenditure calculate the people's caloric needs.
    ${ }^{57}$ At 65 kg , Jerry expended 1.16 Kcal per minute sleeping, and to estimate the minimum energy he needed when not working, I multiplied this by the mean length of nighttime per month and the 2.25 hours for breakfast and dinner. I then adjusted the energy expenditure calculate the people's caloric needs.
    ${ }^{58}$ Cornmeal contains 1,679 calories per pound. Salted pork could come from multiple parts of a pig, with one enslaver noting that "sides and shoulders" were ideal for enslaved people (Southern Planter 1852, 224). However, enslavers commonly issued "fatty" meat (e.g., Draughon 1850; Holston 1858; Tattler 1851) that likely has as many calories as modern bacon ( 2,483 calories per pound). Fattier or leaner meat would shift the daily caloric average.

[^47]:    ${ }^{59}$ Cost calculated using the average price Edward Sperry paid for cornmeal (\$0.011 per pound) and bacon (\$0.08 per pound) at his Middletown store (Sperry 1839).

[^48]:    ${ }^{60}$ Here I include sources from the lower South because while these sentiments exist in journals we know circulated widely in the Valley, they are stated more directly in literature from the lower South. Some Valley enslavers read journals from the lower South (Ploughboy 1841), so we know they at least encountered these more explicit statements about enslaved people's biological needs.

[^49]:    ${ }^{61}$ Sperry paid the same price per bushel of shelled corn (around \$2) to enslaved and White sellers but paid enslaved sellers around twice as much per pound of cornmeal ( $\$ 0.025$ and $\$ 0.011$, respectively). If we adjust the price of cornmeal sold by enslaved people down to $\$ 0.011$, they still account for $21.8 \%$ of the total corn sales.

[^50]:    ${ }^{62}$ Unhatched eggs are those cracked open before they hatch. With domestic poultry, this is usually from people eating eggs.

[^51]:    ${ }^{63}$ Chicken prices vary widely in the ledgers, so I cannot determine if Hite paid below market price for chickens.

[^52]:    ${ }^{64}$ Frame's black ledger is not in the archives I initially used. I only became aware of it in December 2020 and was not able to include it in my research because I could not safely access the archive during the Coronavirus pandemic ${ }^{65}$ This ledger has miscellaneous entries running through the 1880s, but I focused on the entries form 1841-1842 as these are the most pertinent to my research.

[^53]:    ${ }^{66}$ This book was incorrectly identified by archival staff as a personal ledger used by John Cooper and David Davis between 1808 and 1882 and is referred to in the archives as the Cooper/Davis Ledger.
    ${ }^{67}$ I define a transaction as each time a person bought goods from or sold goods to a merchant, regardless of how many or what kind of items they bought/sold at that time.
    ${ }^{68}$ I excluded four of transactions from my analysis. All are large sales of wheat/flour made by Black men ("Negro Charles," "Negro Daniel," "Negro John," and "Negro [Illegible]") on White men's accounts (Sperry 1839, 72, 116, $126,151)$. These sales are more in line with the products sold by free farmers than the enslaved people in the ledger, who primarily sold corn/pork. In two instance, Sperry notes "paid to Negro" by the account holder (Sperry 1839, 30, 32), so it is possible that the four men listed above were selling grain on their enslaver's behalf.

[^54]:    ${ }^{69}$ I do not include the Baker Store or 1806 Middletown ledgers here because of the small number of transactions involving enslaved people in these books (five and nine, respectively).

[^55]:    ${ }^{70}$ Some studies suggest that enslavers issued ceramics to enslaved Southerners (e.g., S. M. Moore 1985; Otto 1984), but do not provide evidence for this. In fact, Solomon Northup $(1853,194)$ wrote that while enslaved in Louisiana he was never issued a "dish... nor any other thing in the shape of crockery." Furthermore, a wide variety of forms and decorative techniques and motifs are usually found at quartering sites (e.g., Galle 2010; Reeves 2015a; A. L. Young 2004) making it unlikely that ceramcis from quartering sites were primarily issued as rations. We also recovered at least 104 tea wares from Quarter Stie B (see Chapter 8) and the Hites are unlikely to have issued tea wares to enslaved people, let alone at a scale that can account for the number of tea wares from the site.

[^56]:    ${ }^{71}$ Conducting the minimum vessel count in this way might result in some vessels being counted twice, but this is offset our increased ability to see ceramic trends in different parts of the site. Most vessel sets not associated with the manor house (see below) are not found in multiple parts of the site, suggesting that few vessels are being counted twice.

[^57]:    ${ }^{72}$ This analysis does not include dipt or sponge-decorated vessels, as these were not sold in sets.

[^58]:    ${ }^{73}$ The Shannon-Weaver diversity index is 1.998 for the manor house pearlwares and 4.212 for the whitewares.

[^59]:    ${ }^{74}$ In this unit the colonoware sherd was found (QB116), the burned debris sat on top of a clearly defined layer of soil that accumulated while the cabin was inhabited, so the colonoware could not have been deposited under the cabin before the fire.

[^60]:    ${ }^{75}$ Samuel Snavely (1810) and John Dalrumple and George Crissinger (1812) advertised their wares in the Farmers Register, offering credit and "reasonable terms" to merchants and resellers, but it is unclear if they were primarily advertising to the multiple towns or to merchants in Shepherdstown, where bother potteries were located.

[^61]:    ${ }^{76}$ To avoid double sampling vessels that might be in both Midden 2 and Midden 1 or 3, I only selected vessels from Midden 2 that did not appear visually similar to any NAA samples from Middens 1 and 3.

[^62]:    ${ }^{77}$ Stoneware vessels require certain types of clay that is refractory enough to survive a higher firing temperature (over $1,250^{\circ} \mathrm{C}$ ) and whose silica particles will fuse together at these temperatures, creating a vitrified ceramic body. While refractory clays are common in the Valley, not all deposits can create vitrified bodies (Comstock 1994a, 66).

[^63]:    ${ }^{78}$ Hilliard (2014) focuses on eastern seaboard (Georgia through Virginia), but many of her sources are from South Carolina and her discussion frequently focuses on the state.

[^64]:    ${ }^{79}$ The reports he cites for the Virginia data (Trickett 2013a; 2013b) also lacks this information.

[^65]:    ${ }^{80}$ Christopher Fennell (2017) used a selection of merchant's ledgers from the Valley to argue that White Shenandoahans rarely bough tea wares before the 1830s, which would make the large amount of tea wares at Quarter Site B unusual for the region, possibly indicating that enslaved Shenandoahans acquired many of the teacups and saucers sold in the Valley in the late $-18^{\text {th }}$ - and early- $19^{\text {th }}$ centuries. However, I could not replicate the trends White ceramic consumption Fennell identified using my dataset (Appendix F, Table 12), suggesting that his results may not be indicative of local consumption practices.

[^66]:    ${ }^{81}$ Fennell does not provide comparative percentages from sites outside his study area.

[^67]:    ${ }^{82}$ Local merchants sold lids separately (Account Book 1800, 154), so I list the lid as its own vessel. Additionally, my list excludes three vessels that might be either utilitarian wares or locally-made tablewares.

[^68]:    ${ }^{83}$ Data from the last two days of analysis (R066-R077) had significantly different FTIR peaks that seemed to lack much of the background interference from the extraction solution, so these data are presented in their own table in Appendix G (Table 3). Nothing about the laboratory procedures was altered on those two days, and nor were new bottles of solvents used. After comparing the data, it appears that R066-R077 can be used in conjunction with peaks from the other samples, and this should not affect the results discussed below.

[^69]:    ${ }^{84}$ I include vessels listed as "pots" in this category as this catchall term was used to refer to crocks and jars (Ketchum 1991a, 32-33).

[^70]:    ${ }^{85}$ Given other wear on Vessel 2.016, it is possible that the spalling is from thermal wear instead of fatigue. However, Skibo (1992) notes that thermal spalls generally occur in parts of a vessel that are not in direct contact with food, and as the spalling is getnally on the base and the lower walls (where food is most likely to be located) it seems that this is more likely to be the result of fatigue spalling.

[^71]:    ${ }^{86}$ The Homer and Nelson Account Book lists one stoneware jug sold between 1849 and 1858, which cost $\$ 0.1875$ (Homer and Nelson 1851, 161). However, I was not able to determine comparative costs for stoneware and earthenware jugs as the price of the other 15 earthenware jugs they sold during this time varied unpredictably.

[^72]:    ${ }^{87}$ Subfloor pits are small cellar features commonly found under the homes of enslaved Virginians. Patricia Samford (2007) argues that these could have been used as shrines, storing personal items, or, when located in front of a chimney base, storing sweet potatoes, but the size of the subfloor pit at Cabin 1 (approximately $7^{\prime} \times 4^{\prime}$ ) makes food storage the most likely use of this feature.

[^73]:    ${ }^{88}$ This stands in marked contrast to how $18^{\text {th }}$-cenury maps depicted West Africa, where it was Africans who were neatly and orderly displayed on the landscape. However, in this context, this cartographic practice was more likely mapping out what Europeans considered to be the location of exploitable resources (people who could be enslaved) than attempting to stake out Africans' claim to the landscape.

[^74]:    ${ }^{89}$ Other architectural artifacts (nails, hardware, window glass, etc.) do not cluster in the same way, suggesting that the brick concentration is not the result of debris being piled up in a single location after the fire.

[^75]:    ${ }^{90}$ I was unable to perform experimental and archaeometric studies to provide further evidence for this argument before this chapter was written. I am working to secure funds and laboratory access to perform this analysis.

[^76]:    ${ }^{91}$ I do not know if other cabins at Quarter Site B also had stoves, so I cannot speculate on whether the stove marked House site 1 and its occupants as different from the other people in the quarter or if stoves were present in all the cabins at the site.

[^77]:    ${ }^{92}$ While these religious view played a larger role in European definitions of humanity before colonization and the subsequent enlightenment (Latour 1993; Wynter 2003), they did not entirely disappear with the emergence of Wynter's Man1 (see Chapter 3).

[^78]:    ${ }^{93}$ Roberto Strongman (2019) argues that transcorporeality is key aspect of African-diasporic religions, with the body become a literal vessel for spirits, thereby queering modern ontological distinction between human flesh, human psyches, and more-than-human forces. Yet, these instances are understood as spectacular pairings of human and spirits while the former is in a trace. This suggests that while enslaved people may not have understood there to be a complete separation between humans and spirts, transcorporeality still indicates that human are different than spirits (a spirit can inhabit a person, but a person cannot inhabit a spirit), thereby defining what it means to be human by understanding people in relation to spirits.
    ${ }^{94}$ Work by Mark Leone (e.g., Leone and Fry 1999) suggests that charms are commonly found in the northeastern corner of buildings inhabited by enslaved people. However, we could not determine the orientation or extent of House Site 1, so I do not know exactly how this crystal relates to the building's footprint.

[^79]:    ${ }^{95}$ The pans have evidence for direct contact with a heat source. This type of contact is unlikely to occur when cooking with the types of stoves that were installed in House Site 1. Therefore, it is more likely that the pans were used in open fires outside of the cabin.

[^80]:    ${ }^{96}$ Thy et al. (2018) estimated temperature by analyzing meted silica droplets from the house (also see Thy et al. 2015). We recovered analyzable silica droplets (melted bottle and window glass) from House Site 1, but I could not get these tested in time for dissertation. I am working on securing funds to test the droplets and conduct a magnetic susceptibility and natural remanent magnetization analysis of the refired ceramics (Francés-Negro et al. 2019; Goodwin and Hollenback 2016; Rasmussen et al. 2012) to provide a more precise estimate of the temperature of the house fire.
